Nogales *Oasis*: The new triple hoisting engine at the Creston shaft has been in operation now about a month. The depth it can reach is 2500 feet. A foundation has been laid for a new air compressor, which will be one of the largest in the world.

Despite the recently published assertions that the great deal for purchase of the Amarillas and Grand Central mines at La Colorada had been closed, and that the other negotiations for the Creston, Colorado, Minas Prietas and other properties were drawing to a close, it seems nothing is definitely known as yet of the outcome, although every confidence seems felt that both deals will be completed. A representative of the intending purchasers remains in the camp, and to him a daily report is made of the output of bullion, concentrates, etc.

It is reported that Jesse Grant, formerly of Nogales, and son of U. S. Grant, together with an Eastern associate, have bought from Jose Vidal and Emiliano Ibarra, for $40,000, the Recompensa, Jesusita and Aguajito gold mines at Jacalitos, Lower California.

SOUTH AFRICA.

The South African *Mining Journal* gives an account of the successful treatment of slimes at the Robinson mine. A contract was made last year with the Rand Central Ore Co. to treat 500,000 tons, much of which is dry slimes, the accumulation from past workings. The treatment of the first 30,000 tons yielded about 6600 ounces of gold. In May, after everything was in good shape, 6623 tons yielded 1584 ounces. The old slimes contain some 30 per cent of sand, which, however, appears to be mostly wind drift from the residue dump. This sand is, however, separated by spitzkasten and treated separately. Taking May as a fair working month, the average bulk of slimes per diem is about 230 to 250 tons, of which about 130 to 150 tons are old slimes. The capacity of the plant is being increased and the monthly output will soon reach 9000 tons.

South African *Mining Journal*: "The inactivity which crept over the market at the end of last month has been intensified by the entire absence of business throughout the whole of this week. The termination of the half year was considered by some as being the cause of this cessation of dealings, but the absolute quietude which prevails now points to some other cause as the reason for the dullness. The spread of the native rising to Mashonaland has created a very uneasy feeling, and fears are openly expressed that risings may take place in consequence in other parts of the country. The advices from the north as to the punitive measures taken by the authorities are considered very unsatisfactory, as, until more active steps are taken to put down the risings, little hope can be anticipated of renewed buying setting in for either Charters or gold shares."

The report presented to the annual meeting of the East Rand Proprietary mines, limited, showed that the company owned 1252 claims.

Coast Industrial Notes.

—Washington State sawmills have quit buying logs "till after election."

—Boring for oil has been begun by the Pioneer Oil Co at San Bernardino, Cal.

—E. S. Babcock of San Diego proposes to erect large Roman baths in that city.

—It is again announced that active work will be begun on the Monterey & Fresno Railroad.

—The first through train from Stockton to Fresno over the S. F. & S. J. V. road arrived in Fresno on the 14th.

—The call for bids for supplies for Mare Island Navy Yard includes 242,000 feet of seasoned Oregon pine for ship deck plank.

—Creosoted lumber is now used in building and rebuilding piers at the city water front; $25 per M feet is the latest contract price.

—The North Pacific Coal Company announce that they will make regular shipments of coal from their Roslyn mines to San Francisco.

—The money necessary for a bonus for the proposed cold storage and power plant at Petaluma has been promised by the citizens.

—The owners of the Point Loma oil well near San Diego have stopped work to await contractors from Pennsylvania who are to sink it to 200 feet.

—Owing to the remarkably large runs of salmon in the Fraser river, it is claimed that this year's output of the canneries will be the largest in their history.

—Collector Wise is about to advertise for bids for furniture for the custom house, to cost about $8000. It is to be made to order, of quarter-sawed oak, oil finished.

—The Stockton, Cal., Gas and Electric Co. began this week to operate the electric car system of that city by power generated by an engine using natural gas, using 200 feet per hour.

—The Cook Power Co. at Santa Cruz, Cal., will duplicate its present plant, adding 250 H. P., and will build a 3,000,000-gallon reservoir. The line will shortly be extended to San Jose.

—Work of boring for oil has been commenced with the plant lately erected by Charles Sonntag and others of this city on the Josiah Allen ranch near Lafayette, in Contra Costa County.

—A proposition is being considered for bringing electric light and power 24 miles from the Little Sur to Pacific Grove and Monterey, to be used for electric railway and light systems.

—Henry A. Butters and his associates, said to be English capitalists who have made money in Africa, have made an offer to take over the Los Angeles Railway Co.'s stock and bonds. The amount involved is understood to be over $4,000,000.

—A cigar-shaped raft similar to that illustrated and described one year ago in these columns has been constructed by Capt. Robertson at Stella, Wash., and will be towed to this city next week. It contains nearly six million feet of lumber.

—Arrangements have been made by the San Francisco and San Joaquin Valley Railroad directors for the issuance of $6,000,000 in bonds, to be secured by a blanket mortgage on their line from Stockton to Bakersfield and all their rolling stock and terminal rights.

—The Brown's Valley, Yuba Co., Cal., irrigation system has been leased by F. W. Page. Pushed to the limit of its possibilities this means cheap power for the mines of that vicinity and sufficient electric generation to supply Marysville with light and power.

—The steamer Moana being built on the Clyde for the Union Steamship Company of New Zealand, to take the place of the Monowai next March, will be 360 feet in length and 44-foot beam with a capacity of 4700 tons or 1000 tons more than that of the Monowai and will have a maximum speed of 16½ knots.

—The Board of Prison Directors will be compelled to close the jute mills at San Quentin for two months, unless the State Board of Examiners will allow them to overdraw their accounts for August and September. There is a deficit of $13,240, caused by the failure to sell grain bags, of which 2,500,000 are now on hand.

—Arrangements for the consolidation of the two leading lighting companies of this city, the San Francisco Gas Light Company and the Edison Electric Light and Power Company are nearly completed. It is proposed to organize a new company to be known as the San Francisco Gas and Electric Company to take over the properties of the two old concerns.

—The Farmers' Loan and Trust Company has brought suit to foreclose a mortgage for $15,000,000, given by the Oregon Improvement Company in 1889 to secure the payment of $5,000,000, for which a mortgage had been given in 1880. The property involved includes 16,954 shares of the Seattle Coal and Transportation Company, the stock of the Columbia and Puget Sound Railroad and all other property owned by the defendants.

—The secretary of the Smithsonian Institute, Washington, sends word of a letter from the U. S. Legation at Pekin to the State Department, stating that the Pekin University has recently opened in one of its buildings a museum, which it is proposed to devote largely to the exhibition of foreign machinery and mechanical appliances, visited by people of the better classes, interested in acquiring some knowledge of foreign manufactures and inventions, and it is believed that it can be made an important means of advertising and introducing the products of American industry. The authorities of this museum would be glad to receive and exhibit working models, photographs, or drawings of machinery and invention, or specimens thereof, such as plows, ships, firearms, cannon, electricity machinery, cars, locomotives, windmills, looms, printing presses, wagons, engines, etc. Each exhibit which may be presented to them will be marked in Chinese with the name and address of the maker, together with description and price thereof if desired, and capable translators will explain their use to inquirers. The letter to the State Department says that this is a good opportunity for manufacturers in this country who wish to reach the Chinese market. Correspondence on the subject and articles for exhibition may be sent to the Pekin University, Pekin, China, or to C. H. Taft, 78 William street, New York. Under an arrangement with the I. M. Customs, all such articles will be admitted to China duty free.

Personal.

H. M. GORHAM has been appointed superintendent of the Savage mine, Virginia, Nev., to succeed the late General Keating.

THOS. F. EWING is the new manager of the Diamond Hill mine, Helena, Montana, recently purchased by a Glasgow syndicate.

JULIAN SONNTAG, secretary California Miners' Association, goes to Oroville next week to reorganize the Butte Co. Miners' Association.

THOMAS EWING of Oakland has returned from Montana, where he assisted in the sale of the Diamond Hill mine to a Scotch syndicate for $2,000,000.

O. S. CRESSEY, of Providence, R. I., who has been developing mining property in Shasta and Plumas counties returns home this week "till after the election."

SUPT. MELZER succeeds R. Recknagel in the management of the N. P. mine at Bourne, Or. The latter assumes the superintendency of a New Zealand mining property.

P. B. TOD, of Pietermaritzburg, one of the owners of the Jubilee mine in the Transvaal, has been examining the Bunker Hill mine in Ventura county for some English capitalists.

L. GILSON, who was called to England by the Exploration Company and has been connected with the management of its affairs in London during the absence of Hamilton Smith in America, is about to return to this city.

WILLIAM T. ST. AUBURN, formerly of the Niagara mine in Shasta county, who went to the Rhodesia mines in South Africa early last year for the Chartered Company, has returned to this city on his way to New Zealand, where he goes to inspect some mining properties for an English syndicate. Mr. St. Auburn narrowly escaped becoming a victim of the Matebeles.

JOSEPH MCGILLIVRAY has lately been in Spain, making an examination of some historic gravel mines in the Province of Leone, which were worked by the Romans some 2000 years ago and described at length by Pliny. They are extensive, the Romans having worked several thousand acres by drifting and by "booming" on a scale unknown in modern times. The mines have lain idle since the Romans quit them, and some French capitalists now propose to reopen them.

Recently Declared Mining Dividends.

Dalton & Lark of Utah, $12,500; payable August 15th.

Daly Mining Company, Utah, $37,500, payable September 1st.

The Isabella Company, of Cripple Creek, $22,500, payable August 18th.

Elkton Consolidated Mining Company, Cripple Creek, $10,000, payable August 20th.

The Anchoria-Leland of Colorado declared a dividend of 1 cent per share Aug. 7th.

The Le Roi mine, in the Kootenay district, declared a dividend of $25,000 on the 4th inst.

The Sacramento of Mercur, Utah, paid its first dividend amounting to $2000 on the 17th inst.

The Portland Gold Mining Company of Cripple Creek has declared a dividend of $30,000, making $240,000 for the first eight months of the calendar year.

The Byron N. White Company of Milwaukee, owners of the Slocan Star, in the Kootenay district, have declared a dividend of $100,000, payable Sept. 1st. This is the third dividend of the company and makes a total of $250,000 distributed.

Obituary.

PROF. J. D. WHITNEY died at New London, N. H., on the 19th inst., aged 77. He was a famous instructor and an authority on mineralogy and geology. He was appointed State Geologist of California in 1860, and the first few volumes of the MINING AND SCIENTIFIC PRESS contain much of his work. He began what was intended to be a thorough geological survey of this State and laid the foundations for topographical work. In '74 the legislature discontinued the work. Besides Prof. Whitney's contributions to this paper, he wrote several reports and minor works and published six volumes of his "Geological Survey of California." His name and fame as an earnest scientist will long survive in California. Mt. Whitney, the highest point in the State, named for him, will also perpetuate his memory.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

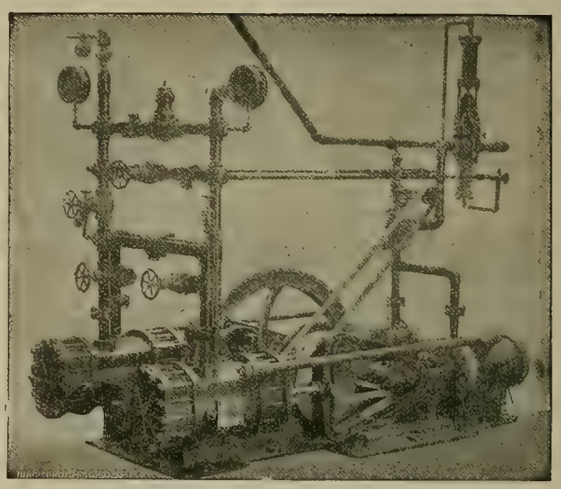
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

"HERCULES" MINING HOISTS.

In ordering a new 10-horse power Hoist the Texas Consolidated Gold Mining Company wrote: "We hope your 10-horse power outfit will be as good in proportion as the 4-horse power we now have; the latter can't be beat. We hoist 700 pounds 150 feet out of a perpendicular shaft, 30 to 35 tons in ten hours." The same company wrote later:

Please permit us to express our entire satisfaction with the 10-horse power Hercules Gasoline Engine and Hoist purchased from you last August. We have worked it for the last three months and find it to do excellent work; likewise the 4-horse power Gasoline Engine purchased some time ago, which is now being used for the lighter work. Yours very truly, TEXAS CON. GOLD MINING CO.

The Manhattan Mining Company now uses three of our Gasoline Engines for pumping on the lower levels at a cost of $9 per day for fuel and labor, as opposed to $36 per day for doing the same work by steam.

The Amalie Mining Company bought a 3-horse power "Baby Hoist" as an experiment, and within six weeks ordered another 6-horse outfit.

The HERCULES GASOLINE ENGINE AND HOIST is the most simple, compact and economical in the market—occupies less space and does more work for less money than any other Hoist.

Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys or building.

Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.

Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

PAYNE'S

PATENTED

GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

☞ Woul sell an interest to right party.

DEWEY & CO., PATENT SOLICITORS.

220 Market St., San Francisco, Cal.

WHY THE SPRINGER CONCENTRATOR IS THE BEST.

It will do more and cleaner work than any Rubber belt machine.
It weighs only one-half as much as some of the other six-foot Concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any.
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer Concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other Concentrators.

I. S. Van Winkle & Co., 413 Market St.

SAN FRANCISCO, May 27, 1896.

DEAR SIRS:—In a letter just received from our Superintendent, Mr. Trowbridge, he says, referring to your Concentrator: "The new Springer Concentrator is fulfilling every expectation. A few minor points may be improved upon, but in its main features it is almost perfect. I shall write more fully after further work." Yours very truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

Extract from Letter of W. S. Trowbridge, Superintendent Bald Eagle Mining Co. June 20, 1896.

"We work twenty tons of ore per day and size out all coarse portion after it has been worked over two other machines, and run all the slimes and finer portions over your machine. I think it would easily handle twice the quantity. It is certainly doing splendid work now, in a difficult place. I believe the belt will wear indefinitely."

July 12, 1896.

Ship us by steamer another six-foot Canvas Belt Springer Ore Concentrator and have the new Rubber Flange attachment, and put a rawhide belt on wheel. Yours truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

HAMMOND M'F'G. CO.

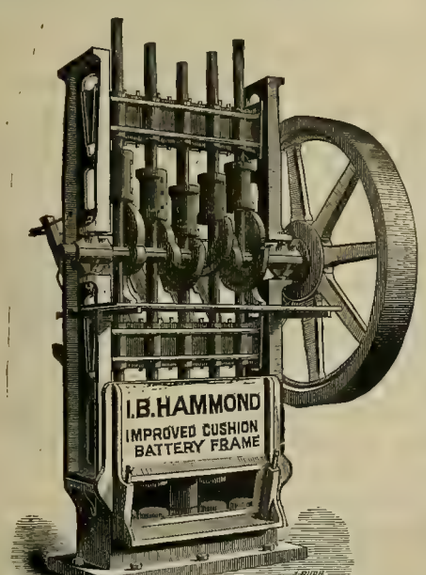
MANUFACTURERS OF

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.



Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

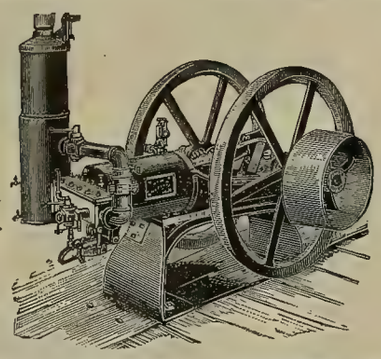
SAVE MONEY BY USING



THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c.	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c.	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¾c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

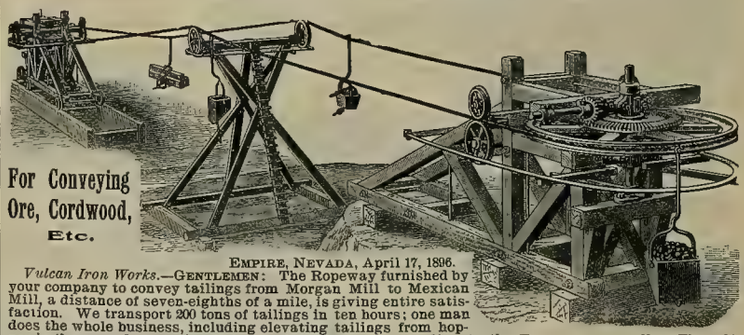
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 20, 1896.

Jobbers state that the demand is confined largely to assortment buying, owing to the unsettled condition of affairs; but even these purchases foot up well at the end of the week. This would seem to indicate that the consumption has increased on this coast. In the writer's rounds he noticed considerable goods going out on orders for distant points, several of which have heretofore confined their buying largely to Eastern trade centers. The improvement in the market value of wheat so early in the harvest season is accepted as a favorable sign. The improvement is due to the Government's estimate that this year's crop in this country will be the smallest since 1893, which, taken in connection with the light stocks the world over, ought to favor the bull side. The gold mining industry continues to forge ahead, with a steady influx of miners to the more favored localities. Manufacturers do not report any material change in the general condition of their business.

The local money market works close, yet there does not appear to be any difficulty met by borrowers having first-class security. The demand for money is said to be slow, due to merchants not carrying heavy stocks and to a general trimming in expectation of a stringent market. Past experience has proven that when this spirit of caution prevails the expected does not come. Exchanges on the East and Europe favor buyers, causing quotations to be largely nominal. The money situation at New York seems to have changed for the better. While there is a good demand from the central-Western and Southern States for funds to move the crops, there is an increased offering of foreign money on 60 and 90 days—some with a gold clause and others without it; but lenders do not find as many ready takers as had been expected. The Canadian banks were, at last advices, in the market as lenders. The low rate of sterling exchange will admit of importation of gold from Europe.

New York Silver Prices.

NEW YORK, Aug. 20.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	31 1-16	67⅝
Saturday	31	67⅛
Monday	30⅞	67
Tuesday	30⅝	66¼
Wednesday	30⅜	65⅝
Thursday	30½	66⅛

	Copper.	Lead.	Iron.	Tin
Friday	10 85	2 70	10 25@12 50	13 30
Saturday	10 75	2 70	10 25@12 50	13 35
Monday	10 75	2 70	10 25@12 50	13 35
Tuesday	10 75	2 70	10 25@12 00	13 30
Wednesday	10 75	2 67½	10 25@12 00	13 25

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	Par
New York Telegraphic Transfer	Par
London Bankers' 60 days	$487½
London Merchants	$4.86
London Sight Bankers	$4.89
Refined Silver, per oz., 1000 fine	68½
Mexican Dollars	53@53½c

All exchanges are nominal.

SILVER.—The market dropped the past week in London to a lower figure than has ruled since 1894, whence it sold at 27 pence. At the decline there were heavy purchases both at home and abroad for large moneyed interests. Advices from the East note continued free shipments to Europe. In our market business is light, both for speculative and export account. Prices at the East and also abroad recovered slightly yesterday. The strengthening is said to be owing to reports that the Argentine Republic is negotiating a loan of $150,000,000 with an American syndicate. With this money it is expected that specie payments will be resumed, which, if done, will cause that country to take large quantities of silver.

A New York exchange of August 10th says: Pixley & Abell report shipments of silver from London to India, China and the East as follows for the year to date:

	India.	China.	Straits.	Total.
1896	£1,990,578	£574,413	£517,532	£3,082,523
1895	2,198,330	1,100,767	503,403	3,802,500

Pixley & Abell say that some holders of United States bonds have bought "calls" on silver, good till the end of the year, to protect themselves against loss in the event of free coinage.

MEXICAN DOLLARS.—Dealings are light with quotations largely nominal at 53@53½c.

COPPER.—While our market is quoted nominally unchanged, Eastern markets are easy at a decline. The lower prices are in sympathy with European advices and also some selling pressure by producers. The consumption in this country is light, but Europe continues to report a free consumption with an increase looked for in November.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is essentially unchanged.

Domestic trade, per flask	36 00

For export quotations are nominal, but less than for home.

ANTIMONY.—The demand is fair, with the market steady at 7¾@8⅛c in a jobbing way. New York mail advices quote 7⅞@7½c for Cookson's, 6½c for Hallett's and 6¼c for Japanese, from store.

LEAD.—The market at the East is lower than at any time in its history. This is said to be due to large stocks abroad, continued heavy offerings from producers and the limited demand which rules at this season of the year.

Pig	—	@	3 65
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—The market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do.	"	"	1 45

TIN.—The decline in silver has affected, unfavorably, the market for pig tin. Eastern advices state that the demand is light, with tinplate makers well supplied for their nearby wants. Our market is weak at quotations.

Pig, per lb			14
Plate, I C coke, heavy, per box	$4 10	@	—
" " " light, "	4 00	@	—

BORAX.—There is a good shipping demand.

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	5¼
Concentrated, "	5⅝

POWDER.—The market is firm with a good demand ruling.

The market is quoted as follows

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—While quotations in our market are reported unchanged, it is said the market at the East is unsettled, with furnace companies shutting down. Notwithstanding this, the stock is said to be large, with buyers finding favor from sellers.

Our market is quoted as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50

Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

COAL.—The demand is said to be improving slightly for both steam and domestic, but more particularly the former. This is due to crop moving and more demand for transportation facilities. The market remains unchanged; for forward shipments quotations are given quite lower than ever before known.

COKE.—The market is quoted as follows:

Gas Companies'	—	—	— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—It is reported that some cutting is indulged in. The home demand is slow, but the export movement is good. Export clearances from this port for the first seven months of the calendar year compare as follows in feet: 1896, 16,854,917; 1895, 9,095,875.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is dull and easy.

The market is quoted as follows:

Wire, carloads, basis per keg			$3 20
" jobbing, " "			3 30
Cut, carloads, " "			2 95
" jobbing, " "			3 05

Mining Share Market.

SAN FRANCISCO, Aug. 20, 1896.

The market eased off slightly last Friday and Saturday, which was followed by a setback of 10 per cent towards the close of Monday. This had the effect of drawing in considerable outside shares that were on a margin. Chollar sold down to $1.80, Potosi 83 cents, Con. Virginia $7.60, and the others in proportion, except the Gould & Curry shares, which, as usual, lost the most. Tuesday afternoon the market began to recover and by Wednesday afternoon there was a rally of 20 per cent from the low prices in the shares of the mines, excepting Con. Virginia, which advanced 15 per cent. Having ground on the Brunswick lode, the rest of the market strengthened somewhat in sympathy. It seems as if the muinstay of the market at present is the work being done on the Brunswick lode, with Chollar still the leader. So far the showing does not justify even current prices, except as an investment gamble, and this is always risky except to those who can afford to lose the invested money. It is to the 400-foot Hale & Norcross and Chollar level that mining men look for a verification of their prediction that the ore found on the 200-foot level and on the 300-foot level will improve with depth. If their opinion is proven correct, and the lode found wider and ore richer and stronger on the 400-foot level, then better prices than now rule are justified on an investment proposition; but if the lode should not come up to expectations, then present prices are far too high. Judging from the way Occidental has worked the bulls may get the worst of the bargain, although the ore in the lode of the latter mine below the 750-foot level is proving stronger and more in keeping with that in the Comstock lode. There can be no doubt that a strong bear feeling prevails on the street, and also with moneyed outside operators. They reason that conditions are against a deal until after the presidential election unless a body of ore is shown up, which they claim cannot be done. The bears also say that the close money market on this coast and at the East is against an upmove, as are the assessments levied, with more coming on. It is reported that the following companies will levy assessments within the next thirty days: Ophir, Gould & Curry, Union, Andes, Utah, Challenge, Yellow Jacket, Potosi, Alta, Occidental and Seg. Belcher. As for the correctness of this report the writer can not vouch, yet it is safe to say that it will prove correct within the next sixty days.

The activity in the New York market for railroad and industrial shares and in Chicago for wheat has drawn many operators in mining shares to those markets. From the Comstock lode the news is essentially unchanged; the work underway points to time and expenditure of money, yet each month puts the mines in better condition for working more advantageously in 1897 and 1898, when the business and finances of the country will have resumed their normal condition. In Alta they continue to find good ore while sinking on the Keystone vein. Overman is still raising a few tons of ore each week. In Seg. Belcher they have resumed extracting and raising ore while prosecuting work. Last week about 30 tons were raised that assayed a little over $20 a ton. The nature of the work in Belcher is still a profound secret; outside of the statement that ore is being raised no information is given out. In Crown Point work is continued on the same levels heretofore reported. There is nothing new from Yellow Jacket. There was a light increase in the number of tons raised by Confidence, but the assay was lower. When the powers that be are ready there should be quite a large increase in the quantity and grade of ore raised by Confidence, and Challenge also be brought to the front as an ore producer. Perhaps it is shares and not ore that is wanted. The joint Challenge, Confidence and Con. Imperial crossdrift is being pushed west as is crossdrift No. 3 in Con. Imperial. In Alpha they are still working in the 500-foot level; the formation is looking better. Work in long crossdrift in Bullion is continued to the west, with no particular change to report. In Potosi they are still prospecting in the 450-foot level without finding anything, so far as the public is advised, worthy of mention. In Chollar active work is continued in the 450-foot level. They raised 120 tons of ore last week assaying $32 a ton. This is an increase in quantity and also in grade, yet the public has no faith in it, for it may like the ore in the Savage disappear in some kind of mysterious way. In Hale & Norcross work is being done on the same levels and direction reported last week. A few tons of ore are raised each week. Work is being prosecuted in the 750-foot and 950-foot levels of Savage with nothing new reported. The joint Best & Belcher and Gould & Curry east crossdrift from the Banner shaft workings is being slowly pushed ahead. From Con. Virginia there is nothing new to report since last weeks' PRESS. Work is continued in the same levels given in that issue. Some seepage of water is reported in the 1000-foot level of Ophir's west workings. In the central tunnel workings the general prospects seem to have improved slightly. The work in Sierra Nevada, Union, Utah and Andes is in the same levels and direction given last week. The general formation is about the same.

From the Brunswick lode our advices continue to report favorable on the ore below the 750-foot level of Occidental. It has more the formation of a well-defined vein. Active exploiting work is being done in the levels heretofore published. In Chollar the south drift on the 200-foot level and that on the 300-foot level are being pushed ahead towards the Potosi line. It is stated that the latter level is still looking well. It is expected that towards the last of next week the winze in Hale & Norcross will have reached the 400-foot level, but drifting south will not be well under way for a few days, owing to some necessary work having to be done. Mining men stake their reputation on this level showing a decided improvement over the 300-foot level. They look for it in both Hale & Norcross and Chollar. The north drift in Hale & Norcross is being pushed forward to the Savage line. In the latter mine and also in Gould & Curry, Best & Belcher and Con. Virginia the work is about the same as heretofore reported. Some miners look for an improvement within the next thirty days.

From the Bodie district our advices are practically unchanged. Active dead and exploiting work is being done by Bodie, Mono, Bulwer and Standard.

The market opened this morning barely steady. After regular Call prices shaded off, but towards noon, under a demand for Best & Belcher and Con. Virginia, they strengthened. The advance in the latter two is based on an east crossdrift having been started in Con. Virginia on the 1650-foot level towards the Best & Belcher line. Four years ago a small deal was made in Best & Belcher, the shares selling up to $11, when they ran three crossdrifts to the east, but nothing of value was found. It is said that they were too high up to strike the ore, but at the present depth they expect to strike it; but what will be its value it is hard to say. The west Con. Virginia crossdrift was run into the ore body, which was found quite wide, but low grade; yet at the present depth it may be richer. It is purely a gamble—something or nothing. The market opened strong and slightly higher this afternoon. At this writing it looks as if Chollar will soon lose its leadership. This the MINING AND SCIENTIFIC PRESS predicted it would on the next upmove.

The following illustrates the changes of the week:

An experienced and practical mining engineer will be open to engagement in a few weeks; best of references, including present employers. At present am superintendent of a mine; am a mechanic, surveyor and assayer. Address "Superintendent," care of Mining and Scientific Press.

An Ex-Supt. and Mining Engineer,

Lately returned to California, desires a situation. Best of references. Address No. 37, this office.

SITUATION WANTED

By an experienced Amalgamator and Mill Man who thoroughly understands his business. References furnished. Address W. A., this office.

WANTED, 2 or 4 VANNERS.

Must be in good condition, and cheap. Address LOS ANGELES GOLD MINING CO., 449 Wilcox Building, Los Angeles, Cal.

PARTNER WANTED

With $500 for expenses of incorporating extensive gold mining properts on the mother lode. Address Box 905, this office.

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

1015 Seventeenth St., Cooper Blk.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

Assessment Notices.

CONSOLIDATED IMPERIAL MINING COMPANY. Location of principal place of business, San Francisco, California, location of works, Gold Hill Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 24th day of July, 1896, an assessment (No. 37) of One (1) Cent per share was levied upon the capital stock of the corporation payable immediately in United States gold coin to the Secretary at the office of the company, Room 35 third floor Mills Building corner of Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of August, 1896 will be delinquent and advertised for sale at public auction and, unless payment is made before, will be sold on TUESDAY, the 22d day of September, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors

C. L. McCOY, Secretary.

Office Room 35, Third Floor Mills Building corner Bush and Montgomery streets, San Francisco, California.

BELCHER SILVER MINING COMPANY. Location of principal place of business, San Francisco, California, location of works, Gold Hill, Storey county, Nevada

Notice is hereby given that at a meeting of the Board of Directors held on the 5th day of August 1896, an assessment (No. 35) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room No 37, third floor, Mills Building N. E. corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 30th day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors

C. L. PERKINS, Secretary.

Office Room 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

JAMISON MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street San Francisco California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors o the Jamison Mining Company, held on the 22nd day of July, 1896, it was resolved that any stock upon which the assessment shall remain unpaid on the seventh day of September, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, September 28th, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Wanted,

To Purchase, Second-Hand,

1 Huntington or Bryan or Briggs Mill and equipments, 1 Challenge Ore Feeder, 1 or 2 Concentrators of standard make, 1 Rock Breaker, 1 Steam Mine Pump 14-inch discharge, 1 ten-horse power Engine and Boiler, 1 Davis or Common Sense Whim, 1 Steam Hoister capable of sinking 300 to 500 feet, 2 ore cars, 1 Water Skip, and an equipment of Mine and Mill Tools.

Give full description of condition, how long in use, distance from railroad and cost of freight to railroad, and price of each article.

Address ELLSWORTH. care of Mining and Scientific Press.

Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

220 Market Street ..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners

By C. W. Moore. With numerous illustrations.....$4 75

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men In cloth, postpaid.....$3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standare authority of the world in Copper Smelting. Profusely illustrated.....$5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.

By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.

By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. This new and important book s on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.

By T. E. Van Wagenan.....$1 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.

By A. H. Hiorns.....$1 50

The Old Prospector.

The prospector depicted on this page differs considerably from the miner, and still more from the mine developer. He is the pioneer; whatever his present work or prospect, he sees greater things in the future, and to him Hope always tells a flattering tale. Lacking in concentration, he distributes his work; usually devoid of business instinct, he works hard and dies poor. He loves variety and change, and is aways ready to drop "ounce diggin's" and investigate elsewhere. The class he represents has roamed over every available spot of mineral ground from Alaska to the Gulf of California, blazing the way, and those who follow ride in palace cars across the land he blazoned white with bones. What he does is for the love of it; he finds a pleasure in the pathless woods, a rapture on the lonely mountain side, a deep delight in tramping through the gulch, following up the mother vein that produced the bit of float. A divine discontent is a part of his makeup; when in Nevada he tells of going to California or Montana, "where there is grass, wood and water;" when in Oregon he most approves Arizona, "where one can get a prospect anywhere," and in the Black Hills of South Dakota he loudly proclaims the advantages of a prospector's life in Colorado. Travel and adventure are his enjoyment; the finding of a prospect is incidental.

A miner may sometimes be a prospector, but a prospector is rarely a miner; the hum-drum, every day work of mining is not to the prospector's fancy. He sees something bigger ahead and is going to strike it rich somewhere else. Sometimes his golden dreams are realized, but not often. He fills a unique, though important, place in the mining industry, and his occupation is largely a matter of temperament. Once the fever of prospecting gets in a man's blood, he rarely does anything else than continue his quest for hidden wealth till the great change that comes to all alike.

THE OLD PROSPECTOR.

Among the many differences between American and European mining methods is the manner of management and system of operation. In this country mining is mainly carried on by individuals or by close corporations making no reports, and furnishing no statistics as to income. In Great Britain and on the continent the business is almost entirely in the hands of companies. In Europe, as a rule, mining investors make a business of joining those companies, the dividends being their annual profit. Their losses in one company are expected to be made up by their gains in another. They usually stand ready to go into any mining scheme endorsed and guaranteed by men whom they believe to be responsible. After awhile they learn what to leave alone, with increasing safety for their investments. This country, as compared with Europe, is the individual system as compared with the company system. A good many things in the mining world are done differently in the old country from their manner of administration here. It has occurred, even in California, that a stockholder, for instance, has had difficulty in securing information as to the workings of the mine in which he held shares. In England it is a prison offense to hold back any news from a mine more than forty-eight hours. This law is enforced. All information must be truthful and must be immediately accessible by shareholders at the company's office. Any one, on payment of twenty-five cents at the proper office, can see in London exact up-to-date statements concerning the workings and expenses of any mine incorporated under British law. This country knows more about mining, but the old country can teach this considerable about the satisfactory handling of mining companies. It is to be said that in speaking of "American mining methods" the fact is recognized that there is no uniformity of methods in this country. For instance, there is a notable difference in the Colorado and California methods, caused somewhat by the non-assessable character of Colorado mining stock, and the more conservative character of mining operations in this State, the difference in this and other regards being interesting; but, in general, there is a notable difference between American and European mining systems in the manner of handling the property.

A proposition is on foot to work the large iron ore deposits of Shasta county, near the junction of the Pitt and McCloud rivers, by electric process. In Fresno there has been incorporated lately a company to work the Minaret mines within the Yosemite national grant, which contain, besides some of the precious minerals, large bodies of iron ore of good quality. The drawback to smelting iron ores on this coast has not been lack of quantity or quality, but cheap fuel. If some of the many processes for smelting iron ore by electricity which are being tried and for which much is promised shall be proven successful, there will be no better field for their application than in this State, where we have almost unlimited supplies of water in torrential streams within easy reach of the ore deposits for generating the required electricity. The consumption of iron on the coast is large enough to maintain an extensive industry. A local supply of cheap iron would do more than anything else to stimulate manufacturing on this coast. A great advantage here possessed is the climate. In many manufacturing-centers climate is often a serious drawback to continuous and economical work, while here, winter or summer, the weather can never interfere.

Want of Sampling and Failure of Hydraulic Enterprises.

A large proportion of the so-called big hydraulic mines in California, developed and operated up to the time that the anti-debris fight closed them down, were not paying investments. This was not due, to any great extent, to bad business management or want of knowledge of the best methods of working in vogue, but to the fact that there was not enough gold in the gravel to pay for working. With the owners of such mines it was the same old story as with the quartz mines upon which mills were built before pay ore was developed. People went to mining without mines.

In many cases expensive ditches were dug, hydraulic pipes put up, and extensive flumes and undercurrents built at expenditures of from fifty to a hundred and fifty thousand dollars for the working of large bodies of gravel, without any careful or systematic sampling or prospecting.

An expenditure of large sums in proving the value of gravel was seldom made. In fact, the only case recorded in which this was done on a scale in proportion at all to the magnitude of the undertaking was at the North Bloomfield, where $65,000 was spent to determine the value of the claims and the feasibility of working them.

Then the gravel miners knew much less than is now understood of the mode of occurrence of channels and pay streaks. Then the fact of finding pay gravel in one part of a large body was often enough to satisfy the owner that it was all equally as good. While the best energy and talents of the hydraulic mining engineers were devoted to developing the magnificent system of working gravel which is now the standard the world over, little or no attention was paid to the study of the nature of the gravel beds themselves.

All this is so much changed that now the first thing to be determined in any gravel proposition is the pay value and nature of the gravel. Much valuable information has been gathered on the nature of pay channels which materially assists in determining their probable location. Of late the running of long tunnels and drifts, or sinking many shafts at heavy expense, has been obviated in many cases by the use of well-borers, with which, at a comparatively small expense in most instances, the exact location, nature and value of channels may be determined, or in large bodies of gravel for hydraulicking the value of all that it is proposed to work may be estimated very closely. With gravel values properly determined, no enterprise of the kind need be undertaken without a reasonable certainty of success.

State Work in Mining Interests.

Some comment in last week's issue of the PRESS on the United States Geological Survey suggests a discussion of State work and mining. Of such work in relation to this industry we have in this country three distinct types. 1, Geological surveys by which purely geologic problems are elaborately discussed and little or no attention paid to mineral resources or the mining industries; 2, geological surveys in which the study and advancement of mineral resources are made prime objects; and 3, State mining bureaus by which special attention is paid to the actual mining processes.

The three branches of science from which these types grow are entirely distinct, and, although they successively blend into each other, with some minor digressions, all State work has heretofore followed one or the other of these main policies. It is worth while to consider the ends of such policies in their practical results.

Of the first type, the geological surveys of New York and Illinois are good examples. The State of New York has expended over half a million dollars on her geological survey, and in result has a great number of enormous volumes upon her fossils, and a few small volumes of more or less superficial descriptions of her natural resources. The State of Illinois, although not expending as large a sum, has received even less practical benefit in proportion.

Of the second class we have a number of good examples, of which the geological surveys of Pennsylvania, Arkansas and Missouri may be cited. The State of Arkansas, for instance, has published separate monographs upon the leading mineral resources of the State, such as manganese, iron, coal and marble. These monographs were each prepared and written by the best specialists in each particular branch, and written from a practical standpoint, are complete, clear and comprehensive. Although intended for local use only, they have become invaluable to all workers in those special branches. For, although the State interests are paramount, the value of these interests can only be determined when considered in their relation to like deposits elsewhere. The survey was completed in seven years with an annual expenditure of less than $18,000.

Of the third type the California State Mining Bureau is about the only example. The bureau has collected minerals and statistics of mining industries from year to year, usually over the same ground, and has published some valuable papers upon the mother lode, certain gravel mines and other matters of interest and value. The reports upon mining in the State have little permanent value, but the papers published, especially by the present directory, upon such special subjects as oil, gold milling, reduction processes and timbering are of a vastly higher order.

The application of any special policy is a matter to be adjusted to the locality. It must not be misunderstood that the value of pure science is in any way underestimated, for from the advancement of such is our progress in the more utilitarian arts due. But it is to be remembered that the taxpayer expects the best possible immediate results from his money, and the diversion of this money into profound paleontologic discussions or temporary makeshifts is hardly less than a betrayal of trust. It is to the policy of such a character that the lack of public support is largely due. The public has been disappointed, as in the case of the old California geological survey; support has been withdrawn and scientific work brought into disrepute.

The functions of the geological surveys of the second class and of the Mining Bureau are entirely different and equally important. The simple difference is that one deals with the occurrence of ores and the other with their reduction. That one blends into the other need hardly be mentioned.

That the result of any public work must depend upon the men chosen to direct it needs no repetition. To students of public work in mining interests it is evident on every hand that wherever good work has been accomplished it has been the result of two factors: First, the allowance of sufficient time, without change of support, policy or direction, to accomplish something; second, the employment of specialists whose training fits them for special investigation and whose reputations lie in the result of their work, and who receive credit for such work.

It may be suggested that in the case of the Mining Bureau such specialists cannot be secured for such amounts as the annual appropriation affords. But, as in the case of the Arkansas survey, it has been found that such men may be secured for but little aside from their expenses, provided that due credit is given for the results of their work. Their reward lies in the reputation gained.

The work of the Mining Bureau in the special lines undertaken needs every encouragement, for that recently accomplished is of permanent value. The elaboration of this feature would place California at the head in real practical results.

A New Mining Decision.

This week the State Supreme Court has made a new ruling on a point of interest to miners. In Trinity Co., Cal., the Altoona Quicksilver Mining Co. brought suit against the Integral Quicksilver Mining Co., the virtual issue being: can formal location of a claim be dispensed with and title to mining ground be successfully maintained by holding and working the property. A jury in the Superior Court of Trinity Co. found for the plaintiff. The judge set the verdict aside and made an order for a new trial. Plaintiff appealed. The Supreme Court affirms the action of the Trinity Co. judge. Following is a syllabus of the decision:

Altoona Quicksilver Mining Co., appellant; Integral Quicksilver Mining Co., respondent. Quiet title. Order granting new trial affirmed.

In an action to determine an adverse claim the act of Congress simply requires a contestant to bring such action as is authorized by the laws of the State to determine the right of possession; and such action when brought is governed and determined by the practice and rules of pleading there, irrespective of the act of Congress requiring the suit to be brought. The rights of the parties are to be entirely determined by the laws of the United States granting the right to enter upon mineral lands, and to extract metals therefrom and to acquire title thereto, but the suit must be tried in every respect as though no contest was pending in the land office of the United States in regard to the right to purchase the same. In such a case, therefore, it is error to instruct the jury to find against a plaintiff on the ground that it does not appear that the suit was begun within 30 days after the filing of plaintiff's claim in the land office.

In an action to quiet title a plaintiff is not bound to show the source of his title in his complaint, but to prove his right under a location it is incumbent upon him to prove that the locator is or was competent under the laws of the United States to take, hold and locate mineral land.

A verdict against the instruction of the court is a verdict against law.

The decision holds that where an individual or company takes possession of a claim, holds and works it for five years, as good a title is thus obtained as though a formal location of the property had been made. It is believed this is the first time this question has been judicially determined in this State.

The Supreme Court in this case made another ruling of considerable importance regarding what constitutes labor on a mining claim to comply with the law requiring the annual expenditure of $100 on an unpatented mining claim. The decision on this point is in effect that besides the ordinary work of development, in case the mine be idle, the amount paid a watchman for his services in taking care of the property may be applied to such expenditure and counted therein, provided that there exist on the property such improvements as necessitate the employment of a watchman.

Both decisions are very liberal in the interpretation of law, and it is possible that the precedent thus established may not be upheld by subsequent tribunals of equal jurisdiction.

ON March 31st, 1891, the California Legislature passed a law prescribing that when the required amount of annual labor or improvements—$100—is put on an unpatented mining claim, the owner shall within thirty days thereafter file with the county recorder an affidavit describing the labor performed, the improvement made and its value. The act further provides that failure to make such affidavit renders the mine open to relocation.

Concentrates.

UTAH now gives employment to 6000 miners.

A MOVEMENT is on foot to establish a mining exchange in London.

THE present daily output of the De Lamar, Nevada, mine is 260 tons.

NEARLY eleven million ounces of silver are in the San Francisco Mint.

MINERS' wages at Wardner, Idaho, have been reduced from $3.50 to $3 per day.

OSCEOLA, NEVADA, placer miners report good times and an average of $5 per day to the man.

THE Sutter Creek Electric Light Company have extended their wires to the Bellwether mine.

G. H. GILLETT of St. Paul, Minn., has bought the Sage Hen group of mines, Mercur, Utah, for $55,000.

EVIDENCE of prehistoric working of gold ore is reported from the Sisquoc river, Santa Barbara Co., Cal.

THE last regular monthly dividend of the Homestake mine, Black Hills, S. D., brought the total up to $5,962,500.

THE owners of the Two Brothers mine at Big Oak Flat, in Mariposa county, are arranging to erect a 10-stamp mill.

F. H. HILL of the Wheeler Hill group, near Coulterville, Mariposa county, has decided to put a 10-stamp mill on the property.

A DISCOVERY of rich copper ore is reported to have been made in Trinity county, about fourteen miles east of Trinity Center.

A BLOCK of ore weighing 75 pounds and valued at the rate of $5000 a ton was lately taken out of the Bland mine near Prescott, Arizona.

THIRTEEN location notices of mining claims for working the beds of the Yuba river in Yuba and Nevada counties were filed in one day last week.

SEATTLE, WASH., papers are advocating a proposition to build a large smelter at that place. There are already smelters at Everett and Tacoma, Wash.

THE Providence Company, Nevada City, Cal., will soon let a contract for the erection of new chlorination works to replace those destroyed by fire last week.

GIANT POWDER is being used at the Snake river, Idaho, placers to blow up the river bed to make room for the dredging boat, the water being unusually low.

THE Baltic Mining and Milling Company, at its meeting held in Placerville, Cal., last week, decided upon the erection of a mill on their property near Sly Park.

MR. FOSTER, the Minister of Mines of Victoria, Australia, has been deprecating the introduction of English capital and advocating sole reliance in local resources.

DURING 1895 Great Britain produced 189,652,562 tons of coal, the highest output on record. In the same year there were produced in the United States 186,903,315 tons.

THE Reglio-Electric Power Transmission Co. of Pachuca, Mexico, is about ready to bring in 1200 H. P. to that mining center from water falls twenty-five miles distant.

THE English syndicate which owns the Richmond mine near the Consumnes river, in Amador, intends putting in a large water-power hoist and building a 40-stamp mill soon.

IN Amador county alone it is estimated that there are over 2000 miners employed in the mines and that 300 stamps in the county are crushing over 20,000 tons of ore per month.

PART of the town of Gibbonsville, Idaho, is built on the edge of placer ground recently bought by T. Bruback for $100,000. He will organize a company and buy a large equipment.

UTAH papers report the finding of tin ore at Panguitch, and "a vein 18 feet wide has been traced nine miles." Upon scientific examination it will probably be found to be iron ore.

THE Government of New South Wales is being asked to devote a sum of £10,000 towards equipping and maintaining prospecting parties to search for minerals on behalf of the State.

PATENTED mines are assessable, the same as any other real property. In some counties the assessors value unpatented claims at $100, taough the legality of such proceeding is in doubt.

THE new mining town of Quigley, in Montana, has a population of 700 and has been built up so quickly that the inhabitants have not had time to find out in what county they are located.

RECENTLY a ranch on the Calaveras side of the Mokelumne river was sold for $25,000. There are two mining claims on the plan, and the purchase was made with a view to working the mines.

FOREST fires in the mining districts have been frequent of late, but the damage is not so large in a season now as formerly, owing to the familiarity of the people with methods for combatting them.

THE boom in the organization of new mining companies has declined in Colorado. It continues in Washington State, where a daily average of twelve new mining companies file articles of incorporation at Olympia.

FOR the third time the receiver of the Keystone mine, Lincoln Co., Nevada, advertises the property for sale. This time he says it will surely be bought by New York people, who will reorganize and develop the property.

THOMAS EWING of Oakland, manager of the Diamond Hill mines in Montana, which were lately purchased for $2,000,000 by a Scotch syndicate, is preparing to place an order in this city for a 150-stamp mill for that company.

THE Diestlehorst dredger, which has lately begun operations in the Klamath river near Quigley's, is being run night and day by five men, and it is claimed raises 600 cubic yards of earth a day, yielding 10 cents per yard.

BUTTE, MONTANA, is probably the liveliest mining town in America. The pay roll approximates a million dollars a month. The lowest wages are $3 a day, miners receiving $3.50. Butte has almost 40,000 population.

PROSPECTORS in India are not overly encouraged over the newly promulgated rule that they are not allowed to turn up the ground beyond a depth of two feet, which is not conducive to satisfactory development.

THE recent sale by the Calumet & Hecla (Mich.) Mining Co. of 20,000 tons of old machinery for scrap is commented on in some quarters as needless extravagance. To us it seems like true economy. Economy in mining, as in everything else, is the judicious expenditure of money. Wherever an obsolescent machine can be replaced by one that will produce better results, such replacement is a proper business investment. The fact that the Calumet & Hecla has to date paid dividends aggregating $45,850,000 is pretty good evidence of its managers' sagacity.

A PECULIARITY of Colorado mining stock is that it is non-assessable, though this is not absolute. The stock of the Geyser Mining Co. at Silver Cliff, Col., is assessable. On this property is the deepest mining shaft in Colorado—2150 feet.

THE closing down of the French syndicate's hydraulic mines at Minersville, Trinity county, is only temporary, and on account of the usual giving out of water in summer. They will continue prospecting, developing and fitting up for next season's run.

THE British Northwest Gold Mining Co. has been organized by Seattle and English capitalists, to take over and work the Fishback, Maud and other Quesnelle properties in the Cariboo district, and is said to be the biggest placer concern in British Columbia.

A LARGE number of mining locations have lately been filed in Yreka, Siskiyou Co., showing that there are more prospectors than usual in the mountains. The comparative inaccessibility of the mines in the mountains to the west has long been a drawback to the development of that county.

THE old Crown Point mine, Virginia, Nev., closed down indefinitely last Saturday evening. It was of this mine and the Kentuck that Senator Jones of Nevada, after his unsuccessful fight for Lieutenant-Governor of this State in 1866, became superintendent, and there he laid the foundation of his first great fortune.

HEINRICH, HEDGES & BROWN have bought the property of the San Jose Mining Co., Egan canyon, Cherry creek, Nevada, for $30,000, and will put in a cyanide plant. This property was formerly superintended by Gen. W. S. Rosecrans, when owned and worked by the Donohoe-Kelly Bank of this city, but has been idle for many years.

AT a meeting of business men in Leadville, Colorado, last Saturday, held to devise means to end the strike, a committee was appointed to endeavor to effect a compromise between the strikers and mine owners. It is understood the latter offer to pay $3 per day for every calendar month in which silver averages 75 cents per ounce.

GEORGE B. MCAULEY, secretary of the Cariboo Mining Company, was robbed by a highwayman out of $12,000 in bullion belonging to his company last week. It has become a custom among some of the men who carry bullion in this State to have on hand, ready to hand out of buckboard or buggy, a bogus bar, but, for some reason or another, they do not seem to be held up often.

THE output of borax of the American Company for the three years ending August 31st was: 1893, 7,408,542 pounds; 1894, 7,341,832; 1895, 9,570,849. California's '95 product of borax was about the same as that of '94—11,750,000 pounds. Last year Nevada produced 1,500,000 pounds. The price fell from seven to five cents per pound, a reduction in the tariff opening to us "the markets of the world."

THERE is always more interest shown in the discovery of large nuggets in gravel mines than small gold, but it would probably interest the average gravel miner to know that in Colorado are extensive deposits where there is never found a piece of gold as large as a pin-head, and where, of the average gold, it takes over 1000 pieces to make one cent, or 100,000 nuggets to a dollar. Yet there are enough of them to pay for working the gravel.

THE production of copper from the mines of the United States for the month of July amounted to 37,175,000 pounds, against 35,896,000 pounds in June, an increase of 1,279,000 pounds; the production of foreign mines for July amounted to 16,472,000, against 15,680,000 for the preceding month, an increase of 792,000 pounds; exports from the United States during July amounted to 24,382,400, against 21,952,000 in June, an increase of 2,430,400 pounds.

LEAD is dropping in price to such an extent that the lead-producing mines in Utah and elsewhere seriously contemplate shutting down. With that metal at $2.50 there is little possible margin of profit. The matter is also one of consequence to mines producing high-grade siliceous ores, which need lead as a flux in smelting. Never in the history of mining was lead so low as this week. What a difference between now and '64, when the writer remembers receiving $210 a ton for lead ore on the dump!

IN Cochise county, Arizona, artesian wells are being sunk and water found that will be utilized for mining purposes as well as stock. So near Randsburg, Cal., more water is being found than was at first expected for milling purposes. San Bernardino where no water was supposed to exist flourishes with orchards through the development of water in apparently desert places, and there is no reason to suppose that the same may not be done in the neighborhood of many mines in the southern part of this State, Arizona and New Mexico. Even if the water from these wells is not available for actual working of mills it will be for agriculture and the growing of home produce for the miners.

THE registration of voters in Shasta county shows an increase in the population of that county of over 40 per cent during the past two years, and in Tuolumne of 30 per cent, all due to the development of mines in those counties. Similar showings are made by other mining counties, and in none of them is there complaint of hard times or want of money. This increase of population is not made up at all of paupers or silurians, but of "honest miners" who have ever in California been the peers of any of its citizens. Towns like Weaverville, Yreka, Downieville, Placerville, and many others in the mining districts, are lighted by electricity and show many other signs of prosperity and progress.

THE newspapers published in the mining districts of California show freedom from the "booming" habit. With a few exceptions the journals of the State in these districts show their resources as they really are, and cannot be too highly commended for this. They know enough about mining to realize that a good mine may be given a bad reputation by its owner claiming too much for it; and so with a district. It is easier now to publish a big story of a marvelous find, that has little foundation, away from home than in these guardians of the welfare of the miners. It is sometimes a complaint of investors in mines that they cannot get reliable information from the newspapers of mining districts where the papers credit bonanzas to every location or hole in the ground. The fact that mining in California is conducted as a commercia undertaking, like any other business with as good average prospects of success, no doubt gives the tone to the press.

FRANCIS HEURTEVANT, a French capitalist who has made extensive purchases of gravel mines on the Trinity river below Junction City, has brought suit against J. D. C. Day and Theodore Begel, alleging that some of the property purchased from them was "salted." He alleges that the sampling of the mine showed $8000 to an acre; that it produced only $2000, and that the defendants had placed gold from other mines in the gravel. It is not often of late years that charges of "salting" have been made in California, but the habit still exists, and it might not be a bad plan for the Legislature to pass a law similar to that of Colorado, mentioned in our last issue, in which a severe punishment is provided.

THE second Raad or lower house at Pretoria has passed an act which, if it passes the first Raad and becomes a law, will make it unlawful to sell or give liquor to natives on proclaimed gold fields. President Kruger advises postponement until next year, claiming that it would be unfair to cancel all native liquor licenses at a stroke, and it is doubtful whether the bill will pass the first Raad. Public opinion and the mining industry support the action taken in the lower house. In fact, the question of liquor traffic among the natives has become a serious one with the mine owners; and if the upper house fails to give the desired relief, there will be engendered considerable hard feeling toward the Government. At a late meeting of the Mine Managers' Association some of the members claimed that native labor would become 15 or 20 per cent more effective if the use of alcohol were prohibited.

AN improved bit to be used with an ordinary well-boring outfit for sampling gravel mines, which was made by E. H. Benjamin of this city, has done considerable to bring that method of examining gravel into favor. Instead of the usual bit used, which dragged and scraped, Mr. Benjamin made his with longer point, thrown forward, so that it would cut instead of scrape. The bit takes on the shape of a plowshare, and the gravel may be brought up in large quantities for sampling. About this is fastened a "barrel" of sheet iron. Whenever hard rock was struck an ordinary churn drill was substituted. Mr. Benjamin states that in sinking holes on the Old River mine in Placer county, to locate the channel, two-fifths of a cubic yard would be brought up each time. The total cost of the well-boring outfit need not exceed about $200. While with the bit generally used in well-boring but 25 feet per day could be dug, with this it is claimed that 70 feet of holes may be sunk without any extra labor. The value of this method in locating channels or sampling gravel to be hydraulicked will be apparent to miners. The old method of digging shafts or running tunnels or drifts was not only very expensive, but at best could give no ideas of values over large areas. On the Old River mine 120 holes were sunk in locating the channel at an expense of not over $600.

MINING is not nearly as dangerous an occupation as railroading, according to the statistics gathered. The Interstate Commission's report for the year ending June 30, 1895, shows that the railroads of the United States gave employment to 785,034 persons during the year, an increase of 5,426 over the previous year. During the year there were 1,811 employes killed and 25,696 injured, a decrease of 12 in the number killed and an increase of 2,274 in the number injured. One employe was killed for each 433 employed, and 1 was injured for each 31 employed. If we leave out officials, clerks, telegraphers and take only the trainmen whose service is upon trains, the ratio is 1 killed for each 155 in service and 1 injured for each 11 in service. These may be compared with the men employed in mines. The Mine Inspector's statistics of Pennsylvania show that in the anthracite region, the most dangerous mining field, there were 143,610 employes. Of these 422 were killed and 1,120 injured, or 1 killed to 340 employed and 1 injured to 128 employed. In the bituminous fields of Pennsylvania 84,904 were employed, of which 155 were killed and 419 injured, or 1 death to 548 employes and 1 employe injured for each 203 employed. Taking the two classes together we have of 228,514 men employed 557 were killed and 1,539 injured, or 1 fatality to 410 employes and 1 case of injury to 148 employes. Compared with the statistics of railroad accidents, it appears that railroading is about three times as dangerous as coal mining, and coal mining in Pennsylvania is admittedly the most dangerous of all mining in this country. In Great Britain during 1895 the death rate was 1 in 600 for underground workers in coal mines, 1 in 1,140 for the surface workers, and for underground workers in metalliferous mines 1 in 423.

FROM David T. Day, chief of Division of Mineral Resources, is received a chart showing in detail the aggregate quantity and value of the mineral products of the United States for the calendar years 1886 to 1895, inclusive. This chart contains the revised figures of the director of the Mint as to the gold production of this country in '95, which was 2,254,760 ounces; calculating the value at $20.6718 per troy ounce gives an aggregate of $46,610,000. This is the largest production of any country for that year, and California's contribution is the largest of any of the States—$15,334,317.69. The increase in gold production is illustrated by the figures for '92—$33,000,000. During '95, according to the chart, the silver yield of the U. S. was 55,737,000 ounces, which at $1.2929 per ounce would mean $72,051,000. The greatest silver yield of this country for the last ten years was in '92—63,500,000 ounces. The greatest proportional increase is shown in copper. In '86 the quantity of copper produced in this country was 161,235,381 pounds, valued at $16,527,651; in '95 there were produced 381,106,868 pounds, worth $38,682,347. Looking at the admirably arranged figures, those referring to pig iron are suggestive from an industrial standpoint, showing an increase in production and a decrease in value. In 1890 this country produced 9,202,703 long tons (2240 pounds each) of pig iron, valued at $151,200,410; in '95 were produced 9,446,308 long tons, worth $105,198,550—a shrinkage in value just representing the value of the total gold output of the country for last year. In connection with the revised figures of the director of the Mint as now received, giving the value of the gold yield of this country for the calendar year '95 as $46,610,000, it is in order to quote the following from "Concentrates" on page 43, of the issue of the MINING AND SCIENTIFIC PRESS of Jan. 18th, '96: "According to the estimate of the director of the Mint, the gold yield of this nation for '95 was $52,614,000, which, however, is probably about $6,000,000 too great." That is, eighteen days after the close of the year, this paper figured the gold yield for '95 at $46,614,000, and now the director of the Mint makes our figures virtually coincide with his.

Vein Walls.*

NUMBER II.

By T. A. RICKARD, State Geologist of Colorado.

(*Condensed.*)

Where ore is absent in the Seven-Thirty mine the walls are apt to be particularly well defined; and when there is any thickness of rich silver-bearing mineral present the walls are scarcely to be distinguished, and the rock is hard to break, because it is destitute of convenient partings. The large veins carrying gouge are found to be uniformly poor, except where they meet the very narrow rich streaks which constitute the resource of the property. The Seven-Thirty vein proper is only 2½ inches thick, but it is very persistent through the midst of hard crystalline rocks, and it has for twenty years proved very productive.

In many mines one vein only is exploited, and crosscutting the country in search of parallel lodes is entirely neglected. In others a crosscut is stopped as soon as it reaches the further wall of the particular vein it was started to reach. Both these unwise practices are founded upon a misconception of lode structure, due to a narrow interpretation of the early teachings of economic geology, which lays a misleading emphasis upon the definition and clean-cut boundaries of so-called "true fissure veins." The fact is, as daily observation proves, that there are walls within walls, and walls beyond walls; and that to follow closely any particular hard, smooth rock surface, with the idea that it is the utmost limit of ore occurrence in any particular mine, is to be blind to the realities of geological structure.

In the Canton mine, near Waipori, New Zealand, those who were working the mine had little comprehension of the formation, particularly of its essential lack of definition, and, while admitting that there were several "false hanging walls," insisted that there was only one foot wall, which was stated to be of a different kind of rock, and exceptionally hard. On examination I found that the rock of the supposed foot wall was similar to that of the rest of the gold-bearing country forming the lode, and on a sample of it being crushed and tested in a prospector's pan it was discovered to be richer than that which was being actually mined. It was scarcely necessary after that to insist that a crosscut should be made into the foot wall.

In the Gold Cliff mine, Angel's Camp, Calaveras county, Cal., near the well-known Utica mine, the ore channel consists of a country rock traversed by cross veins of white gold-bearing quartz. The country rock is a greenish gray augite schist (probably at one time a diabase), carrying coarse pyrite near the gold quartz.

There are "walls" ad infinitum. Each cuts off the quartz seams, which occur again on the further side and extend to the next "wall," where they are terminated as before, and so on. A certain portion, 20 to 30 feet in width, of this channel of country is rich enough to work, and is sent to the mill, but the poorer material which lies beyond it has an identical geological structure. Of course, in such a case the "main walls" will depend for their determination upon commercial rather than geological conditions.

Another case in point is presented at the Cashier mine, in Summit county, Col., in which the lode consists of altered quartz felsite, rendered porphyritic by large crystals of feldspar. It is spoken of as a vein 45 feet wide, having a hanging wall of porphyry and a foot wall of lime. The ore is said to be penetrated by dykes of porphyry. The facts are really these: A certain width of quartz felsite within the neighborhood of its contact with the limestone has been acted upon by mineral solutions which probably came up along that contact. There are no walls, the porphyry of the hanging being simply the rock of the ore channel in a less altered condition. The feldspar of the lode rock has been leached out. In the cavities, now partially filled with crystalline quartz, iron oxide and gold, there can be distinguished the outlines of the large (½ to 1½ inches) crystals of orthoclase, whose removal made the rock porous to circulating waters. The mineralization is indicated by the softening and reddening of the porphyry and is most marked along the joints, especially where they intersect. There are occasional portions of the rock comparatively unaffected by the leaching agencies, and therefore appearing as hard, unstained nuclei amid a mass of softer reddish ore. It is these that are locally termed "horses" and "dikes" of. porphyry.

Lodes subdivided by partings parallel to their outer walls often resemble twin veins such as are actually formed by the temporary parallelism of two distinct fissures traveling together after they have united. Such a case is shown in the union of the Old and New Castletown veins as seen in the north face of the 500-foot level of the Drum Lummon mine, Marysville, Mont. The country is clay slate. There is no selvage on any of the three walls, but each is marked by soft, crushed and foliated slate.

The generous lodes of silver-bearing copper ore which at Butte, Mont., penetrate the granite are frequently marked by a brecciation of the encasing country and are accompanied by a mineralization of the granite far beyond the walls or limits of workable ore. In the 300-foot level of the Gagnon mine, 374 feet west of the main shaft, a crosscut shows that the lode channel extends 30 feet north of the supposed foot wall, the enclosed granite being broken and mineralized. Beyond this line the country ceases to be shattered and is no longer impregnated with ore, but is comparatively fresh, hard, normal granite, with a blocky fracture. This outer foot wall of the lode channel is marked by the occurrence of some ore streaks and an accompaniment of seams of clay. The foot wall country has a noticeable number of slips or joint planes. It is separated from the lode channel by a thick layer of tough black clay. Then comes a zone of kaolinized granitic filling traversed by irregular veins of zinc blende and pyrite. Another clay seam divides this part of the section from a band of mixed white quartz and granitic filling, followed by altered mineralized granite, whose southern limit is a third seam of black clay. Then comes crushed, brecciated granite, diversified by quartz and occasional evidences of ore, which extends to the main pay vein (on the hanging) which has the workable part of the deposit.

In mines of this character the geologist may determine the existence of the lode far beyond the limits of workable ore; but the miner will rightly distinguish between what is mineralized country too poor to exploit and the concentrated mineral which will yield a profit.

Where a vein cuts across sedimentary rocks the dislocation may be looked for along the bedding planes. Such is the case at Rico, Col., in the Enterprise mine, where the breast of a stope will show a vein traversed by a fracture at right angles to its walls, and apparently unaccompanied by any dislocation, but further examination will frequently show that there has been a displacement of the country along the dip of the sandstone and limestone beds, in the strike of the vein itself.

When Werner and his school attributed the filling of veins to the agency of descending waters the existence of open fissures at the time of vein formation was conceivable, because the theory necessarily restricted such operations to the vicinity of the surface. But the acceptance of ascending waters as the main agents of ore deposition, and the recognition of the conditions possible to the formation of large masses of sulphides, at once transferred the laboratory of ore formation to a deeper horizon; and the suggestion that veins were filled by the deposition of layers of mineral precipitated from waters passing upward along fissures which were kept wide open during such time as was required for crystalline growth to choke them with ore was immediately ridiculed by the miner, because his daily experience taught him that the vein, once deprived of its filling, did not remain open, but was inevitably closed by the surrounding rock. In many cases, in the absence of artificial means of support, his mine workings collapsed, so that where there was once a level wide enough for a man to walk through there came to be only a seam of mud enclosed in shattered rock.

Despite the miner's objection, however, there is evidence that fissures do sometimes occcur, which have been sufficiently open to permit the tumbling in of large pieces of rock. Such an occurrence was observed in connection with certain faults which disturb the Virginie lode at Roure, near Pontgibaud, France, where, at a depth of 164 feet from the surface, a fault fissure encloses a mass of clayey material containing boulders of black, soft and porous rock, which can be identified as pieces of scoriaceous lava. No such rock occurred elsewhere underground; and the boulders must have been portions of the Quarternary alluvium which covered the outcrop of the lode, and fell into it at the time of its intersection by an open fissure, which long post dated the formation of the ore vein itself. The mines are in a district which has frequently been subjected to earthquakes, and in the heart of a region formerly the scene of great volcanic activity.

We must be careful, however, to distinguish between the formation of cavities within the zone of the vadose circulation and their existence in "the deep," where sulphide ores have their origin.

Two examples may be quoted. The first is in the stopes above the 800-foot level in the Indiana mine, Gilpin county, Col. The lode, which is the California vein, in its extension westward from the Hidden Treasure mine is about 2 feet wide. There is no parting or selvage separating it from the country. The latter is a quartz-feldspar rock, best described as granulite. Near the lode it is seamed and sprinkled with pyrite, and sufficiently gold-bearing to be sent to the stamp mill. The main pay streak is almost entirely composed of black zinc blende which, by candle light underground, contrasts strongly with its encasement of light gray country. The upper part of the vein, in this particular stope, consists of a breccia of zinc blende, with an occasional spattering of wall rock, the latter so disintegrated as to resemble gravel. At one point there is a shred of wall rock lying across the vein. Lower down there are a number of cavities or vugs scattered among angular fragments of ore. It all looks loose, like an old stope filled with ore that has been mined, but the material is hard and difficult to detach without explosives. Lower again, the vein loses both its cavernous and its brecciated character, and consists of a compact body of blende. It may be added that, even where the brecciation is most evident, both walls are lined with a few inches of ore unbroken and firmly attached to the wall rock into which it gradates. The vugs, when first found, were full of gas (CO_2, probably) and the miners suffered from bad air when working in ground of this character. The pieces of blende are held together by a siliceous cement, which also covers each fragment in the form of a gray-blue chalcedonic coating. It is almost certain that the cavities above described contained water, previous to the drainage of the ground by the penetration of the level underneath.

To the General Manager of the
Mining and Scientific Press.

Dear Sir:-

The result of my advertising in the Mining and Scientific Press has surpassed my expectation; I have sold several Stump Pullers through its influence.

I shall take pleasure in renewing my ad in your paper as soon as cuts are ready.

Yours very truly,

A. Barnes

The Accumulation of Amalgam on Copper Plates.*

NUMBER II.

Communications in discussion of the paper of MR. R. T. BAYLISS, presented at the Pittsburg meeting, February, 1896.

Arthur L. Collins, Central City, Col.: The interesting paper of Mr. Bayliss recalls a recent experience of my own, which may be useful as a comparison.

We had occasion recently to rebuild the Hidden Treasure mill, of 75 stamps, at Black Hawk, Col., after nearly ten years of service This mill also belongs to an English company—the California M. & M. Co., Ltd.—operating the California mine, Gilpin county, Col. It is a typical Colorado mill, with roomy mortars, high drop and deep discharge; two inside plates, and an apron plate 54 inches wide by 12 feet long, being used for each battery of five stamps. The ores treated are soft, consisting of quartz and decomposed feldspar, carrying from 10 to 20 per cent of sulphides, mainly iron pyrites and zinc blende. The stamping is very fine, a slot screen equivalent to a 50 or 60-mesh being used. The ore milled yields on an average 6 dwt. of crude bullion per ton, 740 fine in gold and 220 in silver, the balance being mainly copper. But, as large amounts of custom ore are treated at the mill, this fineness varies within wide limits.

On rebuilding the mill, each plate was thoroughly scoured for several hours with sharp sand from the tailings, hot water and quicksilver. The loosened amalgam could then be removed (after washing off the sand with hot water) with a rubber scraper in the ordinary way, leaving the plate with a good, soft surface of amalgam, in excellent condition for further use. In this way an average of $100 was saved from each plate, the crude bullion carrying the ordinary proportion of gold and silver, with a slight increase in the copper, from the scouring of the plate.

To ascertain the value still left on the coppers, five plates were shipped to the Argo smelting works, realizing an average of $150 each, or about 8 ounces of fine gold per plate. Thus, after ten years of constant use, and after about as much ore had passed over it as in the Montana case, reported by Mr. Bayliss, each plate yielded only $250, instead of over $8000.

It is only a rich corporation like the Montana Mining Company, Limited, which can afford to keep $8000 locked up idly on each plate, or $80,000 in a mill of 50 stamps. Without considering interest on so large a sum, possible losses from theft or fire, or even from the abrasion or peeling off of parts of the amalgam scale, should alone suggest some need for improvement. Such practice needs the strongest justification of absolute necessity or direct advantage—neither of which, I venture to think, can be shown for it.

In this district, where over half of the 500 or 600 stamps of the camp are run on small lots of custom ore, on each of which a complete clean-up has to be made, it would be impossible to run in that way. The whole difference probably lies in the mode of cleaning the plates, and especially in the use of the steel scraper. This much-abused tool can doubtless be used so as to ruin any plate; but in proper hands it is indispensable to the thrifty millman. The scrapers used in this district are made from $\frac{1}{2}$-inch steel, about 3 inches wide, ground square across, so as to give two right-angled edges.

We find that with certain ores of this district—notably those from the Bates-Hunter, Fisk and Corydon mines—the amalgam has a strong tendency to form hard scale on the plates, which cannot be removed with a rubber scraper, whisk broom or any such tool. But with a steel scraper the scale can be broken through and cracked off like a layer of dry putty, and this, if done properly, leaves the plate with a soft and "satiny" amalgam surface, if anything better for catching gold than the uneven surface of harder-scaled amalgam. The use of the steel scraper is almost always necessary with inside plates, where the scouring of the heavy mineralized pulp seems to harden all the amalgam.

Experience here shows that amalgam which forms hard scale on the plates yields bullion finer in gold and lower in silver than the softer variety, and it is generally obtained from ores carrying comparatively coarse or flaky gold. Possibly only the coarser precious metal tends to form hard amalgam scale on copper plates, so that while in the Drum Lummon ore, the native silver is the coarser, in the Gilpin county case, where native silver is almost unknown, scale can only form from ores carrying coarse gold.

One part of Mr. Bayliss' experience, as to the increasing proportion of silver to gold in the amalgam caught farthest from the battery, is duplicated here. After the apron plate, an amalgam trap and about 5 feet of blanket sluice, we secure part of the concentrates on percussion tables of the continuous (Gilpin county) type, the bed of the table being made of copper and amalgamated. On these a further trifling amount of amalgam is secured, and still more amalgam gradually accumulates on the tables, forming a rough scale, which is tough enough to trouble even a steel scraper, and can only be fully recovered when the table is worn out. Amalgam secured on this table yields bullion which almost always assays higher in silver and lower in gold than the average secured on the apron plate above.

(To be Continued.)

Pine Creek District, Colorado.

Written for the MINING AND SCIENTIFIC PRESS by H. L. MCCARN.

The new mining camp of Pine Creek, Gilpin county, Colo., is attracting considerable notice at the present time. A number of important strikes of recent date and the excellent showings made by the development work done during the past two years, have demonstrated that gold is there in paying quantities. The district is a large one, its boundaries being as yet undetermined. On the east it merges into the Silver Creek district; to the southwest it is connected with the Yankee Hill district by a chain of promising prospects. The dividing line between Gilpin and Boulder counties may be said, provisionally, to be its northern boundary; the Continental Divide its wall on the west. Superficial prospecting over the district in the past was, in the main, unsuccessful, and to a new lot of prospectors is due the credit of opening up its treasure vaults. Mining men have been inclined to look with doubting eyes on this region on account of its proximity to Central City and Black Hawk, feeling that if it had merit it would have been proved long ago by the hordes of prospectors which flocked to the "Golden Gilpin" in past years and prospected the country for many miles in all directions from Central City.

There are, however, several reasons for the failure of these early prospectors. The country was heavily timbered and the float largely covered by vegetation, which made prospecting difficult. During late years forest fires and the woodman's axe have removed this difficulty to a great extent. The silver excitements at Leadville and other parts of the State also had their effect in drawing the attention of prospectors to what were, at the time, more alluring fields.

But the chief cause of the region being so long in disfavor lies in the lack of knowledge of an important fact which has been demonstrated in late years, that the modes of occurrence of mineral may vary greatly in localities separated only by a short distance. The camps of Ward and Gold Hill in Boulder county, only six miles apart, illustrate this fact. The early prospectors who worked over the Pine Creek district were discouraged when they found that the surface features were different from what they were at Central City and Black Hawk, and as their educations were received at the mines of those camps and their only knowledge of prospecting was gained from observation of the conditions prevailing there, they condemned the Pine Creek district. The mines of Central City and those of Pine Creek do not differ greatly in the character of the ores in depth, but it is in the surface features that the great variation is shown. In the former camp the veins afforded considerable surface pockets of oxidized free-milling ores and the gold was easily saved by mercury, even with the crude machinery in use in early days. The great erosion and disintegration accompanying and succeeding the "Glacial Period" resulted in carrying the gold from the tops of the veins into the gulches, where it was easily gathered by sluicing, and also left the leads in a favorable condition for oxidation to a considerable depth. Pine Creek district, at an altitude of 1500 feet higher, does not appear to have been subjected to this glacial degradation, and, as a consequence, the leads were not scored off as at Central City. Most of the erosion seems to have been due to slow atmospheric action. The veins are oxidized to a very slight depth in many cases, unaltered sulphides being sometimes found at 15 or 20 feet and oxidized ore rarely extending to a depth of over 40 feet.

At from 20 to 40 feet most of the veins "cap," or become practically barren of value, and continue in this unhappy state to a depth of 80 or 100 feet, when the sulphide ores make their appearance. This barren portion, or "cap," as it is locally called, has greatly retarded development; but it has been demonstrated in the instances where the "cap" has been cut through and the sulphides reached that the quantity and quality of the ore has increased from three to ten fold over the surface ores. This class of vein is illustrated as No. 1 in sketch, (see front page), which shows the oxidized upper portion of vein, the "cap" and the unaltered sulphides in depth. No. 2 shows a vein in which the sulphides rush to the very top of "solid formation." The Ingram mine is an excellent example of No. 2, affording as it did unaltered "copper-iron" (chacopyrite) with high gold values at 16 feet from the surface.

No. 1 is, however, by far the more common form of vein in the district. The disintegrated tops of such veins are usually tipped over (as shown in sketch) and stratified in the wash below the vein. This phenomenon is locally called "flow" and is of great assistance in prospecting. When a prospector strikes "flow" in the wash he knows he is close to a vein, and has only to trench up the hill until the "flow" turns downwards and then sink for the quartz. This curved and often fan-shaped "flow" is colored yellow and brown by iron salts, but as a rule carries little or no gold, though the quartz in the vein may be rich. It is probably caused by successive slight land slips, which have in the course of time *tipped over* the disintegrated tops of these leads and stratified the vein matter in the wash below the veins. When the quartz is reached it often shows excellent gold values, but is usually "spotted." It seems as if during the oxidation and decomposition of the tops of these veins some solvent for gold must have been present, resulting in the leaching of a portion of the gold from the ore. This is notably the case with float from the copper leads. Most of such float is practically barren, while the "copper-iron" in the vein is generally rich in gold.

While the top quartz is, as a rule, not rich or uniform in value, there is generally a portion of it which will run well, and good producing quartz may be seen in many places throughout the camp.

One or two mines showed sufficient surface quartz of value to make it a considerable source of revenue, but such veins are the exception.

At from 20 to 40 feet leads of the character shown in sketch as No. 1 usually become barren ("capped"), and remain so until, as before stated, the sulphide ores are reached at 80 or 100 feet. The Platran, Gold Standard and Nancy Lee veins are of this character, and all of them produced sulphides at 90 or 100 feet, with values from three to six fold higher than their surface quartz contained, showing also a corresponding increase in the size of the streaks.

The Ingram and Side Issue mines belong to the class of veins shown in sketch as No. 2.

The former produced copper sulphides, with only a slight coating of oxide on the outside of the ore, at a depth of 16 feet from the surface. At 25 feet there was a streak on the hanging wall averaging 8 inches in thickness carrying values as follows at the sampling works: Gold (about), 3 ozs.; silver, 30 ozs.; copper, 13%—a value as smelting ore of about $90 per ton.

The Side Issue showed a good streak of galena and copper sulphide at 25 feet, carrying high values. Both these properties are in process of development and are making small shipments to the smelters, of the ore extracted in sinking. Several other prospects show partially oxidized sulphides near the surface, but by far the greater number of veins are of the kind illustrated in sketch No. 1 and will require sinking through "cap" to bring them into pay ore.

It will readily be understood why poor prospectors have hesitation in sinking on such veins for fear of getting into "cap," when they lack the means necessary to sink through the "cap" to the sulphides below. A number of excellent looking prospects at the surface were sunk to a depth of 50 feet or so and abandoned in "cap" by the unfortunate owners, who were too poor to sink them deeper. When the characteristics of these veins are more generally understood they will be developed and will doubtless, many of them, make good producers. Pine Creek is notable in the number of veins which show great strength and beauty at the surface, where decomposition and mineral solutions have intensified the streaks and vein structure.

Many of the leads are from 5 to 10 feet in width and cut the formation squarely and sharply. Slickensides and grooved walls are often seen. Owing to the "sheeted" structure of many of the veins "false walls" are common, which renders frequent crosscutting necessary, to avoid the possibility of missing the main ore streaks. The junction of veins at small angles appears to be favorable to the formation of "ore chutes" near the intersections. In addition to the fissures above mentioned, there occurs in some parts of the district another form of veins, which I have termed Foliation Veins. These veins follow the bedding or foliation planes of the schistose gneisses, and often appear to be replacements of the old feldspathic veins, with secondary quartz containing gold. As the gneisses often are but little inclined, the foliation veins have low dips, 30° from the horizontal being not uncommon.

The quartz in these veins is often rich in gold, but the streaks are small and variable, sometimes enlarging into lens-shaped masses of quartz eight or ten inches in thickness and then gradually thinning down to an inch or less. It is probable that these veins are "lateral enrichments" from great fissures which did not break through to the surface, but followed the lines of weakness, i. e., the bedding planes, when near enough the surface to be released from the great pressure of superincumbent rock-beds to which they were subjected at greater depths.

The country rock of the district is similar to that of the entire county—largely gneissic—all the gradations from structureless granite on the one hand to schistose-gneiss on the other occurring. The foliated gneisses in the northern and western portions of the district have rather uniform northerly dips of about 30° from the horizontal. A number of dykes and belts of eruptive rock cut the formation usually in a northerly and southerly direction. One dyke of porphyry, running about parallel with Pine creek, and but a short distance west of that stream, has been traced across the entire district. The rock of which this dyke is composed is of a bluish-gray color where fresh, but in most places is more or less altered and changed to yellow or brown shades by iron solutions. The porphyritically developed crystals are often elliptoid in shape, giving the rock the character commonly called "bird's-eye porphyry."

On the ridge and range of hills separating Pine creek from Silver creek there occurs a fine-grained eruptive granite (?) with porphyritic crystals of feldspar, some of them twinned. A similar rock is seen on Nevada Hill and in other parts of the camp. The crest of Nevada Hill appears to have been a shattered zone through which eruptive matter forced its way, cementing the shattered rock and forming it into a sort of giant breccia. A dyke of breccia with small inclusions cuts through a portion of this hill. The inclusions, averaging an inch or so in diameter, consist principally of a fair-grained hornblende schist of a dark green or black color and stand out plainly against the lighter colored and more acidic cementing magma, giving the rock a mottled appearance. This breccia is impregnated to some extent with copper pyrites, and near the surface is stained blue and green by copper carbonate. The inclusions are fragments of rocks of a different character from any found in place in the district, and are doubtless pieces broken from deep-seated rocks by explosive action. The minerals of the district are as follows so far as observed, viz.: Sulphide of iron of different forms, usually auriferous and often very rich in gold; copper pyrites (chalcopyrite), almost always rich in gold and carrying some silver; galena; iron sesquioxide (hematite), including the foliated variety (micaceous hematite); copper carbonate (rare); barite (heavy spar) in small quantities. Calcite was seen as a vein stone in one mine and molybdenite was also observed in the dump rock of another mine. Specimens showing visible gold are occasionally found, but are rare, although surface quartz assaying $1000 per ton or more has been uncovered in the camp. Tellurium has not been found as yet in the district.

Development work, though limited from lack of capital, has been very encouraging and warrants the belief that the field is destined to be a remunerative one to capital, when combined with good judgment in the selection and working of properties.

The sulphide ores show excellent values and are well adapted to concentration. Much of the ore is rich enough to be shipped direct to the smelters, and the copper and lead present add considerably to the value as smelting ore. Where silica is in such excess as to reduce the value below what is profitable as smelting ore, the simplest forms of concentrators or jigs will quickly and cheaply separate the quartz from the sulphides and leave a clean and valuable concentrate. An abundance of timber and water and a down-grade to the railroad and concentrators at Black Hawk, seven miles distant, are favorable accessories to profitable mining. In the judgment of the writer, who has studied the camp for over two years and watched development, it is well worthy of investigation by mining men. It is useless for anyone to expect to be able to form a just opinion of the district in a day or two's examination. A visitor will be shown good surface quartz and float which will pan well, and will at once wonder why such quartz is not milled. He will be apt to conclude that the veins are pockety and unreliable. In short, a superficial examination of the district will not, as a rule, result in a favorable opinion. It is necessary to study the result of actual development work and the nature of the phenomenon locally termed "cap" to form a just conclusion as to the merits of the camp. The strength and beauty of the fissures; the great improvement both in quantity and quality of the sulphide ores over the surface quartz and the facilities for economical mining are features which should recommend the district to practical mining men. Apex, the principal town of the district, has a population of about 500, and is well supplied with stores, hotels, etc. Stages connect with all trains at Black Hawk, seven miles distant. H. L. MCCARN.

Denver, Col., July 30th, '96.

Scientific Progress.

Utilizing Culm Heaps.

The Corral Hollow coal mines, near Livermore, Cal., now being in operation, it is proposed to establish a power plant there to utilize the coal screenings, generate electrical power and transmit it to San Francisco and suburbs.

The idea is to do the same with waste coal screenings as is now being done with tailings at so many of the mines, turn them into money or its equivalent. Pennsylvania has done it with its immense culm heaps.

In the early history of California gold mining material was thrown away which is producing fortunes for those who came after, and in the history of coal mining fuel has been discarded which in the future is to turn the wheels of industry; and that which actually constituted a drain upon resources made to contribute to the general wealth. The most significant indication of the progress of engineering science is the rapidly increasing directions in which hitherto waste products are being turned to account. A potent factor in scientific progress is the cheapening of methods of producing power; and, perhaps, second only to this in importance is the improvement in methods of transmitting this power from the point where it can be produced to the best advantage to the point where it can be utilized most advantageously. While it is true that there are some industries in which the cost of power forms so considerable a factor in the cost of the manufactured article as to be controlling, it is, nevertheless, true that if we consider the manufacturing industries as a whole the cost of power amounts to only about 10 per cent of that of the product; and in many cases, therefore, it is cheaper to bring the power to the raw material than the latter to the former. Niagara, with its enormous water power now partly utilized, has already attracted the attention of the whole world, and the promise of cheap power is held as an inducement to outside manufacturers to locate there or in the vicinity.

Coal mines, from the time of their opening, have been throwing away material which this generation is beginning to appreciate as of value, and as the old tailings from the mines have been worked over with profit, men are now working over the culm piles from the coal mines and appreciate their value.

As to the available quantity of this culm, perhaps the most reliable estimate is that given by the commission appointed by the Governor of Pennsylvania to investigate and report on the waste of coal. This commission, at the date of its report, May 20th, 1893, consisted of E. B. Coxe, H. S. Thompson and W. Griffith.

After estimating the proportions of the total coal mined that was wasted on the dumps in a number of the leading collieries, which varied from 19.7 to 74 per cent, they say: "Taking into consideration that the percentage of coal now sent to the dirt bank is much less than formerly, and the annual production greatly increased, it perhaps would not be unfair to estimate that, since the commencement of mining, the coal and coal dirt sent to the culm banks has been 35 per cent of the total production, say 315,700,000 tons."

W. Griffith, under date of April 20, 1892, contributed an article to the *Colliery Engineer and Metal Miner*, in which he estimated, on a basis of 20 per cent waste, that the amount of clean coal that went to the culm bank in the Scranton district alone, up to and including the year 1891, was 21,975,444 tons. The estimated total production of that district for the year 1891 was 6,193,390 tons. The output for 1895 amounted, in round numbers, to about 7,000,000 tons. If 20 per cent of this goes to the culm bank, there is a stream of energy annually flowing to that repository of 1,400,000 tons. Emery estimates 14.4 tons of coal per annual horse power, for 365 days of 20 hours each, for simple, high-speed, non-condensing engines.

If we assume that the fuel value of this coal, when recovered, is but 78 per cent of that of the best freshly mined egg, stove and chestnut, this 14.4 tons becomes 18 5 tons, and the 1,400,000 tons now annually going to the culm heap represent a stream of energy equivalent to 75,672 horse power. This is nearly equal to the maximum estimated capacity of the great Niagara tunnel. But, in addition to this as yet practically unutilized flow of energy, there is that vast amount already stored up in the culm banks during the years previous to 1892, estimated at nearly 22,000,000 tons, which, on the same basis, is equivalent to over 1,100,000 horse-power years—the storage of which, in one sense at least, has already been paid for. This annually increasing flow of energy, unlike the Falls of Niagara, has not, as it passed by, dissipated its energy, but in succeeding years has stored it up in an available form for utilization.

Some of the industrial establishments at Scranton obtain their culm from their own mines. One of the largest of these is the Lackawanna Iron and Steel Company. This company charges itself a nominal sum of 10 cents per ton for the culm it uses, and it is shoveled into the furnaces just as it comes from the breaker. When culm is spoken of in the culm bank, it refers to all of the material, both large and small; but when it is spoken of in the boiler house, it means simply the refuse, including dust and finer coal after the larger sizes have been separated. These larger sizes, including buckwheat and pea coal, command higher prices.

The refuse—strictly speaking, culm—is the fuel preferred by the manufacturers in Scranton, except where the haulage costs too much, when bird's-eye, buckwheat, or even pea coal are preferred; but all of the steam raised in this district is raised by the combustion of the products from the culm bank, and by far the most of it from the refuse or true culm. It is this that the Corral Hollow people propose to utilize and the experiment means much to the manufacturing interests of this city.

The Manufacture of Aluminum.

A new electrolytic process for the manufacture of aluminum has recently been patented in Europe.

The process consists in the decomposition by electric current of anhydrous alumina, rendered fusible by an appropriate flux. The inventor states that he obtains the direct decomposition of anhydrous alumina without the use of any salt of aluminum, such as fluorite or cryolite. The inventor, in order to dissolve the alumina, uses fluor-spar, to which he adds chloride of sodium in the following proportions: One part of chloride of sodium to three parts of fluor-spar.

This mixture, he states, melts very easily at a dark red heat, and can dissolve 25% of its weight of anhydrous alumina. By means of the electric current the mixture above noted is melted little by little until the recipient in which the operation is conducted contains enough melted bath, when the anhydrous alumina is added in small quantities till saturation. The alumina is decomposed into aluminum, which deposits at the bottom of the recipient, which serves as cathode and oxygen, and which combines with the anode of carbon to form oxide of carbon. At the end of twenty-four hours, more or less, according to the quantity of the alumina treated, the aluminum is taken away without interrupting the passage of the current, so that the process is a continuous one.

Instead of making the bath mixture of fluor-spar and common salt, one can use equally well alkaline silicate, or, better, boracic acid, or an alkaline borate, without any modification in the operation described above. The difference of potential between the electrodes in the case of the first bath is kept between three and four volts; in the case of each of the other baths, it should not fall below three volts nor go so high as to decompose the bath. Regarding the intensity of the current, it is, in each case, proportional to the amount of metal to be made, and is limited by the excessive temperature which will be produced by a current too intense. The apparatus used to contain the bath is a metallic pot, preferably of sheet steel, lined inside with carbon, and connected to the negation pole of the dynamo, thus forming the cathode again.

The positive pole is formed by a carbon anode which plunges into the fused bath, and is connected to the positive pole of the dynamo. This anode is fixed to a copper rod, which serves to support it, and at the same time acts as a conductor, and permits the anode to be raised or lowered, so as to keep the voltage between the required limits.

Electrical Progress.

The Future of the Roentgen Ray.

Professor A. Van der Naillen, president of the Van der Naillen School of Engineering in this city, delivered an interesting lecture on the Roentgen ray last week at Golden Gate Hall. The Professor has lately been in Europe, where he made a special study of the subject, consulting with the leading scientists of France and Belgium who are experimenting in that line, and brought back with him the newest apparatus and a number of plates, which were displayed with the aid of a stereopticon. Some of these photographs taken in Paris show the rapid progress that has been made since the recent discovery by Dr. Roentgen.

Upon the screen was shown a photograph of a diamond tiara, in which some of the diamonds had been substituted by paste by a swindling jeweler, the diamonds being transparent to the X ray, while their imitations were not, the diamonds being carbon and the imitations containing oxide of lead. The lecturer said that through the same means had been discovered adulteration of saffron by sulphate of barium and also of silk goods, into which certain minerals had been introduced to give body and volume to the stuff. Besides broken bones, the doctors had discovered that some mysterious swellings in the fingers of a girl were due to tuberculosis. Drs. Oudin and Barthelemi have settled the question whether the destruction of the bone in human bodies commenced at the center and worked toward the outside, or vice versa. The radiograph showed that the former was the case.

SKELETON OF FISH AS SEEN BY ROENTGEN RAY.

Dr. Olivier, he said, claims that the Roentgen rays have not said their last word. He predicts that, similar to the rays of light which show an octave of different colors, each having its separate ratio of vibration, and, consequently, endowed with some special properties, so will the Roentgen rays eventually prove capable of dissection and be found to contain diversified radiations endowed with different properties, some showing plainly bones, others muscle and cords, others nerves, others hearts or lungs, while others will bring to light the stomach, the brain, and show each one of these organs by itself, isolated from surroundings.

It appears that there are deleterious effects from the X ray apparatus upon the operators, according to the New York *Electrical Review*. It seems that H. D. Hawks, who had been giving exhibitions in the vicinity of New York with a powerful outfit, was at the end of four days compelled to cease active work, owing to the physical effects of the X rays upon his body. The first thing Mr. Hawks noticed was a drying of the skin, to which he paid no attention, but after awhile it became so painful that it was necessary to stop all operations. The hands began to swell and assumed the appearance of having a very deep sunburn. At the end of two weeks the skin all came off the hands. The knuckles were especially affected, they being the sorest part of the hand. Among other effects were the following: The growth of the finger nails was stopped and the hair on the skin that was exposed to the rays all dropped out, especially on the face and sides of the head. The hair at the temples has entirely disappeared, owing to the fact of Mr. Hawks having placed his head in close proximity to the tube to enable spectators to see the bones of the jaw. The eyes were quite bloodshot and the vision was considerably impaired. The eyelashes began to fall out and the lids to swell. The chest was also burned through the clothing, the burn resembling sunburn. To overcome these effects of the X rays, Mr. Hawks first tried covering his hand with vaseline and then putting a glove on, but the hand was at once burned again, the glove affording no protection whatever. The hand was finally protected by covering it with tin foil. Mr. Hawks coincides with Tesla's belief that X rays are practically minute material particles thrown off from the walls of the tube.

Steel, heated and then quenched in a bath through which an electric current is made to pass, is said to acquire extraordinary hardness, the invention being due to a Swiss engineer named Faux, inhabiting Strassburg, who demonstrated before a commission of engineers that a drill thus hardened passed through a piece of chilled cast iron twice as quickly as it would have done if hardened in the ordinary manner. A circular saw, similarly hardened, cut through iron bars with extraordinary felicity. With shears of this electric steel, an ordinary steel bar 35 mm. wide and 18 mm. thick (1⅜x22-32 inches) was cut through cold; and this operation was repeated five times with the same bar. A table knife cut through an iron wire of 1½ mm. diameter, eleven times running, with the same facility as it would have cut a piece of string if only hardened in the ordinary manner. Examination, by the magnifying glass, of the tools prepared by this method has revealed no change of structure.

Mechanical Progress.

Experiments in Firing a Boiler.

Those who believe that the formation of dense smoke in steam plants can be abated and the smoke nuisance in our cities and towns greatly reduced, and who at the same time believe that the formation of smoke cannot be wholly prevented without a loss in the efficiency of the boilers, will doubtless find support for their views in the results of a peculiar competitive test recently carried out under the auspices of the Sheffield Smoke Abatement Society. Five competing firemen were each allowed to fire a Lancaster boiler for seven consecutive hours, and the prize was awarded to the fireman who evaporated the greatest quantity of water with the least amount of fuel and with the least quantity of smoke. The boiler was 28 feet long and 8 feet in diameter, the two flues being 3 feet 3 inches in diameter at the front, tapering down to 2 feet 10 inches at the back. The grate measured 6 feet by 3 feet 3 inches, giving a total grate area of 39 square feet. The grate bars had ½-inch spaces. The working pressure was 100 pounds per square inch. The

coal used was "washed hard nut" and was of uniform size and very clean. The best result as to evaporation was equivalent to 9.03 pounds of water from and at 212° F. per pound of coal, but the fireman with this record had, on the other hand, the worst showing as to smoke. The first prize went to the fireman who secured an equivalent evaporation of 77.05 pounds of steam from and at 212° F., while only producing dense smoke for six minutes out of the whole seven hours occupied by the trial. This record was beaten by two other competitors, one of whom produced dense smoke for two minutes only and was responsible for an equivalent evaporation of 8.07 pounds per pound of coal, but he produced much more "faint" and medium smoke than the first prize winner, and so failed to head the list. The coal burnt per square foot of grate surface per hour ranged from 23 pounds to 28.1 pounds. Thus we see that the man who produced the least smoke was beaten by three or four of his competitors on evaporation. While this may go to show that an entire absence of smoke from the average boiler may mean a loss in efficiency, it must be in mind that all of the men produced amounts of smoke infinitesimal in comparison with the average fireman of to-day, and that the production of more than formed in the worst of the five trials would doubtless have been accompanied by a falling off in the evaporation. No argument can therefore be drawn against the improvement in the average of present practice so urgently needed.—American Engineer.

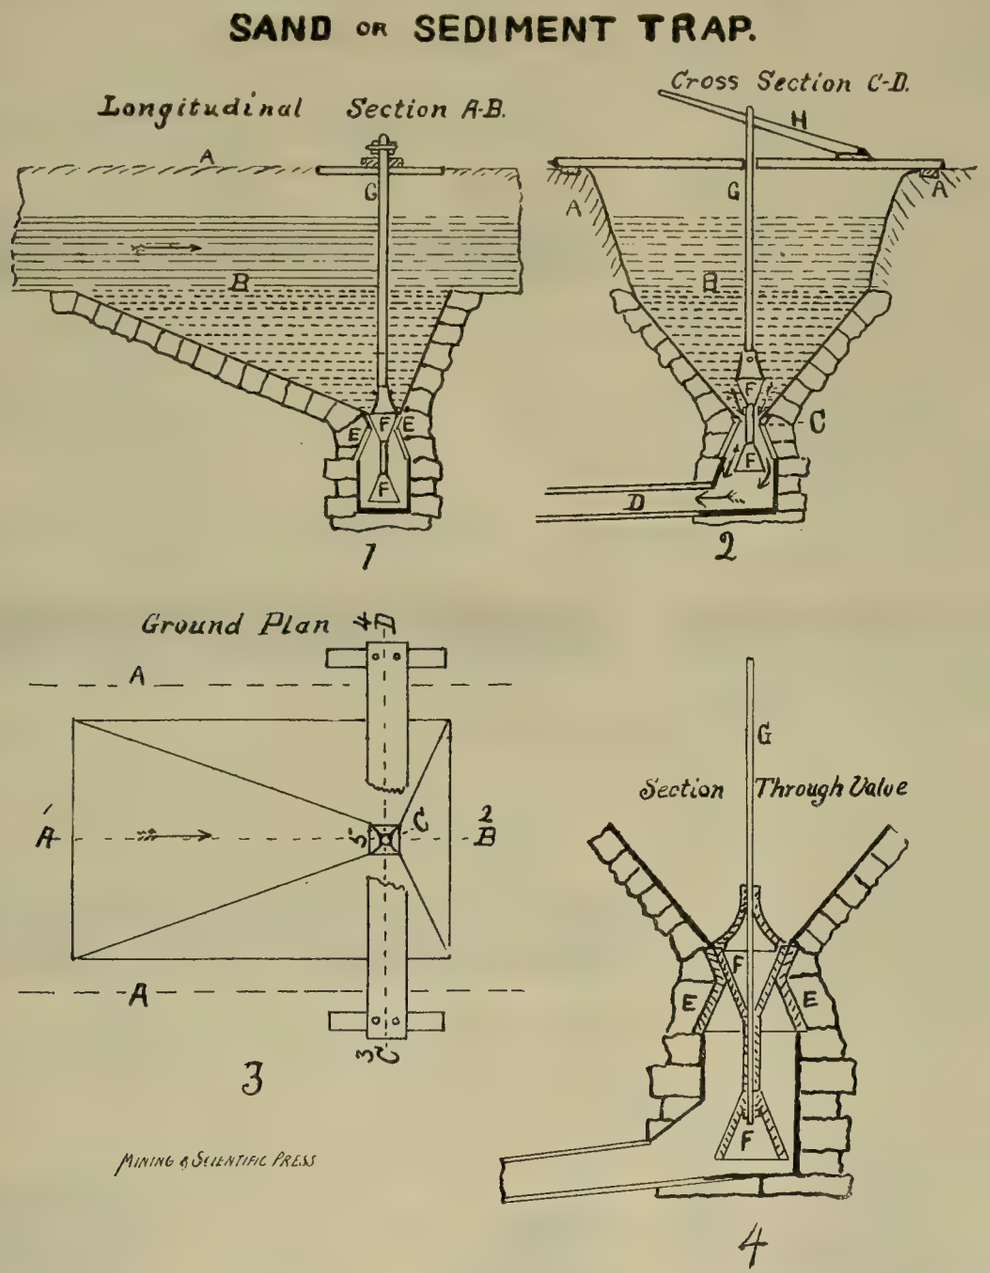
Sand or Sediment Trap.

The accompanying cuts illustrate the plan and details of a new sand and sediment trap, for use in irrigation and other canals, which, from surrounding conditions, are liable to a periodic filling up with sediment. The idea originated with George Ipson, of Salt Lake City, Utah, and was purchased by D. C. Robbins, of the same place, who was successful in his application for a United States patent for the invention. Later a company to handle the trap was incorporated in Salt Lake City; E. G. Rognon, president; D. C. Robbins, vice-president; E. H. Scott, secretary.

The device consists merely of a longitudinal depression in the bed of the canal or ditch, the incline on the upper or stream side being about 22 degrees from the horizontal, while the lower incline dips at about 80 degrees, so that it is impossible for sand or sediment that has flown into the trap to flow out again, until the trap is filled to the level of the bed of the canal. The sides of the trap slope down on an incline nearly corresponding to that of the lower end, so that the four sides of the excavation converge to the common point of the bottom of the pit, which is provided with a circular opening seated to receive a valve. In the original design this valve seat was made 10 inches in diameter, but in actual practice it has not exceeded 6 inches, the latter diameter in every case having proved to be sufficiently large for the drainage and flushing of the trap. Figure 4 shows the form of the valve. Since the idea first took form it has been decided to dispense with the lever, which, in Figure 2, is made the agent for opening and closing the valve, substituting a screw-thread on a rod, which will pass through the bridge across the top of the pit, and will be operated by a wheel similar to that used on the ordinary railway brake. With this improvement, it is expected that it will be possible in many cases to so adjust the valve that a small flow of water can be continuously flowing through and the sediment in the trap removed as it deposits itself. The disposition of the sediment thus discharged will depend entirely on local conditions and surroundings, but in most localities it can be conveyed into dry water ways. The trap can be made of any size, and, consequently, can be adapted to a canal or flume of any dimensions.

The utility of the device is apparent. In instances of heavy freshets it can be made the means of saving thousands of dollars by simply leaving the valves along the line of canal wide open, so that no opportunity occurs for filling up. Those who have witnessed the filling up of an expensive canal in times of flood, know that side outlets are not to be relied on as a means of discharge, and that the later cleaning out of the ditch frequently amounts to one-third the original cost of construction.

The trap is now being introduced in the canals of the Mount Nebo Irrigation Company in Utah county, and the corporation of Salt Lake City has decided to adopt it in the Parley's canyon conduit, which furnishes a considerable portion of that city's water supply.



Practical Information.

Pipe Covering Heat Loss.

The loss from a naked pipe is dependent upon the temperature of steam, and independent of the velocity of the steam in the pipe. Under ordinary conditions, the condensation loss from a naked pipe in still air is about one-third of a pound of steam, or about 320 heat units. This amount is increased by motion of the air. It seems most convenient to refer all steam coverings to the bore of the pipe as a standard, and this method is adopted in the following table. It will be noticed that with some coverings having fairly good conducting power the loss of heat increases with increase of thickness. This is due to the fact that an increase of thickness is accompanied by an increase in surface; if the heat passes readily through the covering, the amount it gives off will depend largely on the nature of the surface, and as this is increased the conducting power also increases.

The following gives results of tests of various pipe coverings made at Sibley College, Cornell University:

Kind of Covering.	*Relative Amount of Heat Transmitted.*
Naked pipe	100.
Two layers asbestos paper, 1-inch hair felt and canvas cover	15.2
Two layers asbestos paper, 1-inch hair felt, canvas cover, wrapped with manila paper	15.
Two layers asbestos paper, 1-inch hair felt	17.
Hair felt sectional covering, asbestos lined	18.6
One thickness asbestos board	59.4
Four thicknesses asbestos paper	50.3
Two layers asbestos paper	77.7
Wool felt, asbestos lined	23.1
Wool felt with air spaces, asbestos lined	19.7
Wool felt, plaster Paris lined	25.9
Asbestos molded with plaster Paris	31.8
Asbestos felted, pure long fiber	20.1
Asbestos and Sponge	18.8
Asbestos and wool felt	20.8
Magnesia, molded	22.4
Magnesia, sectional	18.8
Mineral wood, sectional	19.3
Rock wool, fibrous	20.3
Rock wool, felted	20.9
Fossil meal, molded, ¾-inch thick	29.7
Pipe painted with black asphaltum	113.5
Pipe painted with light drab lead paint	126.7
Pipe protected by wood tube, 3 feet earth	32.
Pipe protected by Wyckoff tube, 3 feet earth	18.

THE methods of the Rathburn Company an Deseronto, Province of Ontario, Canada, are worthy of emulation in many of the finest districts of this country. As described in the *Northeastern Lumberman*, they are making it a point to consume many forest products usually considered as waste material. Their annual drive comprises all sorts and conditions of logs. Of their cedar, for example, what is not suitable for lumber is made into railroad ties, fence posts or blocks for street paving and in some cases into shingles. Of the pine and spruce waste pieces that are not available for laths are cut into match splints and exported to England. Short pieces of lath not long enough for use are sent to New York to be made into banana crates. What is fit for nothing else is used or sold for fuel or used to make charcoal. The policy the company has pursued is more in the line of scientific forestry than most big firms in the lumber business in this country in the management and care of the forests they hold.

A CHICAGO company is constructing a monster belt, the dimensions being as follows: Length, 150 feet; width, 7 feet; weight, 3300 pounds; thickness, ⅞-inch. In its construction the selected portions of 450 oak-tanned hides, picked from over 5000 skins, were used. The belt is to be used in the engine room of the Louisiana Electric Light Company at New Orleans, where it will be attached to the 23-foot driving wheel of a great Allis-Corliss engine.

A FIRE PROOF SAFE made of cement with wire netting imbedded in it has been invented in Germany. One was lately tested by being placed upon a mass of wooden timber soaked in kerosene and a fire maintained for half an hour at a temperature of over 1800 degrees Fahrenheit. After cooling the contents were found entirely unharmed.

THE largest single wood pulp plant in the world is that of the Hudson River Pulp and Paper Co., at Corinth, N. Y., which consumes over 30,000,000 feet of spruce per annum.

CHARLES P. GRIMWOOD,
Mining Engineer and Metallurgist,
Laboratory, 214 Pine St., San Francisco

JOHN H. MEANS, Geologist & Mining Engineer.
Personally reports on mines to determine advisability of extended investigation. Assists upon large examinations. Intricate surveying and economic work for lawsuits. Thorough experience. Abundant references. Anglo-American code. Address 10th Pine St., S. F., Cal.

Robert H. Postlethwaite,
Member Institute Electrical Engineers, London.
Carrville Trinity County.. California.
Having been engaged in the designing and construction of river dredgers for gold saving in New Zealand for some years, is prepared to furnish plans and advice.
☞ Correspondence Invited.

Thomas B. Everett, M. E.
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

EDWARD C. BROADWELL,
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

PROFESSOR GEORGE DAVIDSON,
Late of U. S. Coast and Geodetic Survey.
Consulting Civil and Hydraulic Engineer.
GEORGE F. DAVIDSON,
Agent for Sale of Mines,
530 California Street, San Francisco, Cal.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

W. B. TAYLOR. H. C. WARD.
C. A. LUCKHARDT & CO.,
Nevada Metallurgical Works.
ASSAYING, MILLING AND ANALYSIS OF ORES.
71 & 73 Stevenson St., San Francisco, Cal.

THE SANTA ROSA GOLD MINING COMPANY.
Properties located in the Cripple Creek Gold Mining District.
We believe we can give you the largest prospective value for the least money.
Investigate carefully; hesitate before buying other stocks; consider SANTA ROSA and know why you don't want it.
Call, write or telegraph to F. H. PETTINGELL, 10-11 Bank Block, Colorado Springs, Colo.

M. H. WALSH, Secretary and Manager. C. G. BACON, President.
Sonora Land and Mining Abstract Bureau.
Sonora, Tuolumne Co., Cal.
Abstract of Titles to all lands in Tuolumne County made under the Durfee Self-Correcting and Adjusting System.
Mining properties for sale or bonded on desirable terms. Correspondence invited from principals desiring investments in quartz mining properties or in the development of promising claims. Reliable information given on all matters.

Thomas Price & Son,

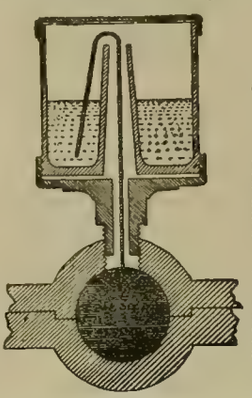
Positively Reduces Oil Bills 75 Per Cent.


THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**
Read One of the Many Testimonials:
UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*
K. J. McHUGH, 25 New Montgomery St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

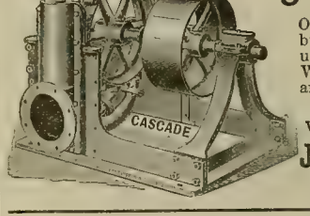
HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces. Etc.
1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

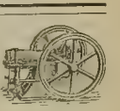
The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

TURBINE AND CASCADE WATER WHEEL
Adapted to all Heads from
3 Feet to 2000 Feet.



Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.
Send for a Pamphlet of either Wheel and write full particulars.
JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

WEBER Gasoline Engine For use in any place or for any purpose requiring power. Only a few minutes' attention required each day. Guaranteed cost of operation is 1 cent per horse power per hour. The simplest, most economical and best power. Address WEBER GAS & GASOLINE ENGINE CO., 430 Southwest Boulevard, Kansas City, Mo.



Mining Summary.

CALIFORNIA.

Amador.

Republican: Supt. Tregloan of the Spring Hill, Medium and Talisman is pressing work ahead. He is prospecting the Talisman from top to bottom, and is getting ready to put in new and larger machinery at the Medium.

The excavation for the new hoist at the Oneida mine is going along rapidly and will shortly be completed. The uprights for the hoist are to be 80 feet high.

Ledger: The shaft at the Treasure is down 400 feet and they are now crosscutting and drifting to prospect the ledge.

The old Wallace mine, now under the management of the White Bros., will be operating again in a few days, equipped throughout with new machinery.

Republican: Argonaut.—Reports are current to the effect that a body of rich ore, of unknown dimensions, has been encountered in this mine. Upon inquiry of those connected with the mine we learn that in cutting the station at the 1250-foot level a vein of quartz has been cut on the hanging wall on each side of the shaft. The size of the ledge is not known at present. While it is not what can be designated as rich ore, it is thought to carry gold in sufficient quantity to pay for working. The strike is not regarded as specially important. It is believed to be one of the ledges met with in the Kennedy, but not the one carrying the richest ore. This is claimed to be some distance in the foothills. A station has been cut at the 1350 level, but no ore body was encountered in doing this work.

Oneida.—Timbers are now being hauled for permanent hoisting works, the shaft is now down 380, and is progressing at the rate of 50 feet a month.

Zeila.—At this mine the rock is low grade, but is paying regular dividends, and whenever a new shaft is sunk six new stamps will be added.

Jackson Gate.—Drifting in the 350-foot level is in progress. The northwest drift is now in 160 feet, and in gold milling rock.

Union Consolidated.—The shaft is now down 390 feet. Shafts are being run in the Gouge ledge east and west. The mill is now being overhauled and will be running within the next thirty days.

Kennedy.—Sinking from the 2050 to the 2150 level in the north shaft is in progress.

Good Hope.—The 10-stamp mill, which has been moved from the Mechanics, is about to erected.

Alma.—The shaft is down 796 feet. Sinking will be continued until a depth of 1,000 feet is reached, when a station will be cut and the mine opened up.

Anita.—The shaft is now down 500 feet. As soon as a sump is sunk a station will be cut and the mine opened up.

Butte.

The Golden Butterfly has passed into new hands. Owing to some disagreement the English syndicate did not purchase the mine, as was anticipated, and it has now passed into the control of a San Francisco company, which will proceed to work it.

James Pullen, who has been developing the Mt. Ida quartz mine, near Hurleton, has gone to San Francisco for the purpose of purchasing a new 5-stamp quartz mill, which will be erected during the present month.

The Banner quartz mill has begun dropping stamps and it is said the run will be a long-continued one.

Mercury: The old '49 mine, now known as the Oregon, situated on the hill above the Enterprise, is showing up well from the development work. Josiah Champion of San Francisco, who purchased it lately, is in charge. One tunnel was run into the mountain about 150 feet, when it tapped the ledge. Here the prospect was such that a lower tunnel was started, which is now in about 400 feet. It is at the foot of this tunnel that the mill will be erected. Eleven hundred feet of steel rails for a railroad track, together with cars, were recently forwarded to the mine.

J. D. Campbell has taken hold of the Old Milard mine and is now running a tunnel to tap a shaft formerly sunk upon the claim, and which proved to be very rich. The claim, however, is located on the bank of the west branch of the Feather river, and water flowed in faster than it could be handled without the aid of powerful machinery, and the work of mining had to cease.

It was in this claim that Ira Wetherbee picked up the 54-pound chunk in 1859. Mr. Campbell now has but a few feet to extend his tunnel to reach the shaft, which will thoroughly drain the claim and enable it to be successfully worked.

Mercury: At the Gold Bank & Stow mine at Forbestown the 40-stamp mill is crushing 143 tons of rock every 24 hours. The improvements on this property consist of hoisting works, a 40-stamp mill with sixteen concentrators, two canvas plants, chlorination works, and air compressor, all run by water power, of which they have an abundance. The development consists of six tunnels and one shaft down 360 feet on the incline of the vein. They are at present working about 100 men in the mine and mill. They are now engaged in running a crosscut, which, when completed, will tap the ledge at 500 feet vertical below the present workings. It is in now about 1800 feet and they are expecting to soon strike the ore body, in which event they will move their mill and other buildings necessary, below the mouth of this tunnel.

Calaveras.

Angel's *Voice*: At Murphy's the De Lays have incorporated their recent purchases of McQaig brothers for $50,000.

It is reported that the much bonded Gumboot mine has again been bonded by Prince Poniatowski.

At the Gwin mine the vein on the 1300-foot level has been crosscut and shows a good grade of milling ore which prospects well in free gold. The grading for the mill is about completed, and the foundation work will be commenced immediately.

Chronicle: Encouraging prospects are reported from the Bund mine, now being operated by the California Exploration Company.

All the machinery for the South Paloma mine is now in place. Operations will be begun next week. The hoist on the mine will be run by steam power, the engine being capable of sinking 1000 feet.

The shaft in the Fellowcraft mine is down 220 feet, and it is expected that the mill will be running in about three weeks.

Men are at work on the Central Hill gravel mine running drifts in the bank for blasting and breaking up the ground preparatory for accelerating work when the season opens. The run of the season just closed was a remunerative one.

At the South Paloma the new 40-horse power steam hoist has been completed and the management is preparing to sink an additional 600 feet in the vein and then drift and crosscut. They are now down a depth of 175 feet.

El Dorado.

(Special Correspondence).—The Lone Jack mine, for two years past in litigation, now happily settled, is about to resume operations. The property is near the Taylor mine, in the Garden Valley or old Johnstown district, about ten miles north of Placerville.

The Baltic Mining and Milling Co. is preparing to erect a 10-stamp mill. Goodwin George is president and Mr. Thurwachter, treasurer, of the company. Postoffice, Sly Park.

John Melton has filed location notice of water right on the south fork of the American river, about three miles from Placerville, for mining, milling and general electric purposes. The papers of record are for 5000 inches under four-inch pressure.

It is currently reported that Stent and Coffin have bought under bond the old Griffith Consolidated and four adjoining claims. These properties are just below and contiguous to the Larkin mine. The Griffith Consolidated, embodying two claims, has a reputable record. If work is faithfully crowded upon this in further development, as has been the case with its neighbor, the Larkin, that section will prove one among California's greatest mining quarters and of El Dorado county's bonanzas.

El Dorado county is gradually becoming known (in spite of her more recent record as a fruit grower) for her large quartz deposits. It is difficult to convince Eastern people that gold mines exist in the midst of gardens and orchards, but personal inspection convinces them of the truth of such facts.

In addition to the two 10-stamp mills recently started, the Boulder and the Star Light, and the Baltic, the Victor, and Lucky Marion at Greenwood, are preparing for the early construction of a mill. Another is the Larkin. Superintendent Jackson is at present in San Francisco negotiating for a complete outfit comprising a 10-stamp mill, to be constructed without delay.

Placerville, Cal., Aug. 26, '96.

Democrat: At the Victor mine, 14 miles east of Placerville on the Mosquito divide, a new body of ore has been unearthed. It is proposed to erect a mill as soon as possible.

An important strike has been made in the Ida Mitchell mine, situated right in the heart of this city. While drifting south, and only 15 feet from the point where work was abandoned some twenty-five years ago, a 5-foot ledge of ribbon-rock was tapped.

The Starlight Completed their 10-stamp mill, seven miles west of Placerville.

Inyo.

Register: The Mammoth mill and mining property is closed by legal proceedings, developed by dissensions among the Chicago owners. As we understand it, the merits of the mine have nothing to do with the shut down, therefore it is presumed that work will be begun again as soon as affairs are straightened out.

At Silver Peak the mill is running day and night, and Chiatovich is preparing to start up his mill in a few days. Two teams are hauling ore for his mine near Gold mountain. He has 400 tons ready to crush. Work is being pushed on the Silver Peak mines by L. J. Hanchett.

Kern.

Californian: In the Panamint district five claims, owned by Cole, Montgomery and others, have been bonded to San Francisco people for $35,000.

Another strike has been made on the Butte mine, at Randsburg, showing free gold in the croppings and sulphurets.

The erection of another mill has been commenced at Goler by J. M. McKearnan of Porterville. It will be only two stamps and will begin crushing Burcham ore.

Mariposa.

Miner: B. S. Hill is purchasing a hoisting plant for the Kohler group of mines.

The Merced Company still continue work in their mines here. Sinking in the Melvina shaft is going steadily on and drifting on the ledge in the Louise still continues. Development work on the Mahoney and Mary Harrison is being pushed.

Nevada.

Union: Twenty stamps of the Providence mill were again started up last Saturday. The remaining twenty are being overhauled and will be dropping in a month.

Transcript: The rumor that the W. Y. O. D. mine was about to suspend operations is pronounced false. The company have recently struck a barren spot in their mine, but they expect to readily regain the pay chute.

Placer.

Capt. Montgomery, owner of the La Trinidad mine, in Sailor canyon, twelve miles southeast of Cisco, will place a mill on the property this season. Fifteen men are now employed at the mine.

Herald: The successors of the Baccarat Mining Co. at Lincoln have sunk a shaft about 25 feet and have found good gravel. It is about two hundred yards east and north of the old shaft.

The Mayflower mill is again running steadily.

Plumas.

National-Bulletin: C. C. Rachford & Co. have their tunnel in about 300 feet and are preparing to wash gravel on their mine on Yellow creek.

Manager Edwards of the Silver King mine in Arizona, accompanied by a photographer, last week went down to Rich Gulch to examine the Hallsted, Duncan and Patten quartz properties, in the interest of an English syndicate represented by C. W. Ertz, who has an option on the properties.

San Bernardino.

(Special Correspondence).—The awakened inserest in mining matters in this section has partially solved the problem of work for the unemployed, for the latter are scattered out among the hills and on the deserts, wherever there is a chance for the discovery of gold or silver. The result has been the locating of more claims during the past few months than for the previous ten years. Scarcely a day passes but there is news of valuable finds. A prospector came in last week from Randsburg, in the northern part of this county, having located at St. Elmo, six miles south of Randsburg. A sample he brought in would probably go up into the thousands. There was an immediate rush of prospectors, and everything in sight was staked out within a few hours. The Board of Supervisors will immediately have a road opened up direct to this future great mining center. The Rose mine was sold recently to a foreign syndicate, and their first work uncovered a body of good ore. This mine is located within a few miles of this city, in the mountain range.

San Bernardino, Cal., August 25, 1896.

Shasta.

Courier: The Three Sisters group of mines in French gulch district, owned by the Ellerys, have been bonded to San Francisco parties for $40,000.

J. P. Kingsbury and W. D. Bull are shipping ore from the old Crystal mine.

The new mill and crusher at Lower springs have been started up.

Free Press: A strike has been made in Supervisor Conant's mine at Harrison gulch of an 18-inch vein carrying considerable free gold.

J. W. Parmelee has filed an attachment suit in the Superior Court for the sum of $10,949.63 against the Parmelee Ore Concentrating Company, a corporation of Chicago, who own the famous Minnesota mine on Spring creek.

Journal: A large number of mining locations have been made the past few weeks, along the Klamath river. The taking up of these claims is evidently inspired by the successful operation of the new dredger on the Klamath river. If the gravel in the bed of the Klamath will go even 20 cents to the ton, it is a paying business, as the big scoop handles a ton of ore each trip.

The Nebraska mill on Cherry creek is in operation.

Henry and George Spannaus who have leased the Magee mine on Klamath river, struck some very rich gravel last week.

Wm. Bennet of Forks of Salmon has been making preparations to work his mines on Salmon river on a more extensive scale this year than usual. He has just finished cutting 120,000 feet of lumber for use in the mines.

Searchlight: During the past week 80 or 90 men were put on at the mines and smelter of the Mountain Mines Company. At the mines the wages are $1 per day and at the smelter $2 and board. Roasters are preparing ore for treatment and the smelter will start up soon.

Supervisor W. R. Conant has disposed of his Harrison gulch properties for $20,000 to Captain Roberts.

Sierra.

Enterprise: The Sierra Gold Co. on the East Fork will soon have all the machinery of the Mt. Moriah mill on the ground. The foundation is now well advanced, so that the new mill will be running on ore within a few months.

Siskiyou.

Journal: The miners on Klamath river are in the midst of their busiest season. It is said that the prospects for most of the river mines is better than usual this year, as they got a good start and their work has not been interfered with since.

At the old Lawson mine, on the South Fork of Humbug, some fine-looking quartz is being taken out. It is contemplated to put up an arrastra on the property soon.

Tuolumne.

Union-Democrat: The Slap Jack mine at Greenland has changed hands and high-grade ore is being developed.

The new electric power plant at the Santa Ysabel and the new hoist at the Dutch are now in operation. The air compressor at the App will be ready in a week.

Material for development of the Whisky Hill group is being hauled on the ground. This is the property recently purchased by the Newcomb-Buckmeister syndicate for $130,000.

It is reported that the Rawhide and App mills will be increased twenty stamps each.

J. L. Coles expects to resume work on the Seminole group next month.

The furnaces for the new chlorination plant at the Rawhide will be begun next week.

E. W. Hebard of the Soulsby mine has bonded the Continental claim, on the south fork of the Stanislaus river.

Independent: The Little Wonder quartz mine at Groveland has been bonded by F. Marconi of Big Oak Flat to Col. Haskell, who is about to commence the erection of a mill.

NEVADA.

HUMBOLDT COUNTY.

Silver State: Tuscarora is looking up. The Dexter company's new quartz mill is crushing ore and development work going on in other mines.

LANDER COUNTY.

At Austin, the Austin Mining Company's tunnel is now 5,000 feet in. There are 1,000 feet more to be pierced; 100 men are at work and it is expected the tunnel will be completed January 1, 1897.

OREGON.

BAKER COUNTY.

Democrat: The sale of the Columbia mine for $100,000, the pending sales of the Baisley-Elkhorn for $100,000, the Simmons group for $40,000, the Bonanza for upwards of $300,000, and other properties in the Flagstaff, Virtue and White Swan districts, at prices ranging from $5000 to $20,000; of properties in the Sumpter and Granite districts, at from $5000 to $50,000, all show that there is a whirl in mining in Baker county.

Jacksonville *Times*: The Applegate Mining and Milling Co. are pushing development work on their group of quartz mines with good prospects.

It is reported that $600 worth of gold was taken out of the Bonanza mine, in Williams Creek district, one day last week.

John and George Anderson have struck a rich ledge on Horsehead creek, Josephine county, from which they are taking considerable gold.

The Seven Devils Mining and Real Estate Company has incorporated; capital, $120,000; office, Baker City.

From the preparations going on in Galice Creek district, there will be more hydraulic mining there during the coming season than at any time in the history of that section. A number of new plants will be put in and some of the old ones enlarged.

In the Flagstaff district, Baker county, the Bradbury Bros. have found a new ledge four feet wide. Scott, Phillips and Kirk have a six-foot extension of the Flagstaff. H. S. Bowen and J. M. Lachner have bonded the Sound Money group to Chicago parties. The Red Jacket is showing ore assaying from $10 to $30 gold.

Simkins & Fowler have completed their wing dam in Rogue river, near Crow's ranch, and are ready for mining operations.

Active operations have been resumed at the Shorty mine in Ashland district.

WASHINGTON.

The Silver Queen Mining and Milling Company has been organized; capital stock, $500,000. This company succeeds what was formerly the Silver Queen Mining Company and becomes the owner of the Silver Queen and Last Chance mining claims on Rickey Hill.

BRITISH COLUMBIA.

Rossland *Miner*: There is a prospect that the West Le Roi and Josie property will soon be rid of all its entanglements and sold to a strong company. There were large transfers of the company's shares last week and it transpires that the Jones-Warren wing have secured control, they now holding over 400,000 out of the 500,000 shares.

In the Galena Farm group which was lately bonded to a London syndicate, for $50,000, it is reported that a rich strike has been made and that there is more ore in sight to pay for the mine.

Work is being pushed on the Slocan Star, Ruth and Wonderful groups of mines, all of which are tributary and close to Sandon. Since the concentrator on the Slocan Star began operations it has worked almost exclusively on the old dumps. So far over 2500 tons of concentrates have been produced and much ore still remains to be treated. It is now evident that the dumps contained nearly 20,000 tons of ore. Most of the ore already treated has produced one ton of concentrates averaging 90 ounces in silver and nearly 70 per cent in lead for each four tons put through the mill. Byron N. White the general manager of the company states that they will realize at least $300,000 from the old dumps.

Spokesman-Review: At Rossland the Novelty, on the south slope of Red mountain, adjoining the California, has been sold to an outside syndicate for $20,000.

Rapid work is being done on the Red Mountain Railway and the graders will be in full sight of Rossland by the end of next week. The road bed will be completed by the first of September, and tracklaying will start at once. The completion of the road will give Rossland an all-rail connection with Spokane.

The official figures of the output of the Kootenay mines for the year ending July 1st are defective, in that they only include the ore exported in the customs district of Nelson and estimates of that which went out through the port of Revelstoke. The output for the year is shown to be 30,673 ounces of gold, valued at $552,135; 1,459,629 ounces silver, $969,215; 11,647 tons copper, $129,250; 6020 tons lead, $220,849, a total valuation of $1,871,449; 6410 tons by way of Revelstoke are estimated to be worth $100 a ton, which adds $641,000 to the foregoing amount, or a total of $2,512,449.

In the Poorman tunnel there are 8 feet of iron and copper ore and no foot wall in sight.

In addition to furnishing the Trail smelter with all the ore the road is able to handle, the Le Roi Company is daily shipping 30 to 40 tons by wagon to Northport, and thence to the coast smelters.

Nelson *Tribune*: The Canadian Pacific Mining and Milling Company's concentrator will be in operation October 15th, and will have a capacity of 50 tons a day. The company's holding consists of four claims on Woodbury creek, near Ainsworth, and will be developed by power drills.

The owners of the Homestake, at Rossland, will endeavor to float a company on the London market with a capital of $1,000,000.

The returns of shipments of bullion, matte

and ore from the mines and smelters in southern Kootenay in one week this month were 901¼ tons, valued at $66,525. Total for 1896 so far, 18,285½ tons, valued at $2,000,850.

A strike is reported on the north fork of the Salmon. The leads are said to be from 15 to 20 feet wide, containing peacock and black oxide of copper.

At Florence P. Fitzgerald has sold his group of claims, the principal one of which is the Bull Pen, to Cunningham & Chapman of the Coeur d'Alenes for $20,000. This includes several placer claims.

ALASKA.

At the Mexican, with the additions lately made, 120 stamps are now falling.

The new ten-stamp mill of the Jualin Mining Company at Berners has started up.

The steamer "Al-ki" at Seattle from Alaska brings seventy-five miners from Cooks Inlet. They had only tales of hardship to tell and came back empty-handed, cursing the country. One man had $5 in gold dust, which he said cost him $500.

The Alaska *News* publishes an interview with William Bowers, an experienced miner, who recently returned from Cook's Inlet. Bowers said: "It is a mistake for those who have failed to find anything this summer to say the country is not good, and that there is nothing in it, for that is untrue. There are good diggings on the tributaries of Turn-Again Arm; ground that pays well, much more than wages; but the trouble is there is not much of it. The gold seems to be scattered over the country in patches. Good ground will be found on this creek and barren ground a few miles distant. The country has been pretty thoroughly prospected this season, as I met men from nearly every spot in the entire region. There is gold there, and quite a considerable quantity, but in my opinion in not nearly sufficient amounts to justify nor support the crowd that flocked there this spring."

The Alaska-Treadwell Company's yearly report shows a production of 263,670 tons, at a cost of 34¼ cents per ton. During the year the mine paid $450,000 in dividends; the net profits were $497,342.

UTAH.

Salt Lake *Tribune*: The deal for the sale of the Sage Hen group of three claims in the Mercur district, adjoining the Sacramento on the south, has been consummated, the owners transferring the property to George H. Gillett, a Minnesota man, in consideration of $55,000.

The incline at the Sunshine is to be continued to a depth of 1000 feet, and the ground as systematically explored from that station as it has been from the upper ones. The same theory is applied to Sunshine by competent mining men as is that which covers Mercur concerning the value of the ores at great depth.

At Tintic a promising strike of an ore body was made in the Humbug last week. The ore is lead and silver, and from six assays made the lowest was fifty-one ounces silver, while the highest ran over 700 ounces, and an average of the ore body, which is about six feet wide, is 143 ounces silver, $15 gold and 36 per cent lead.

L. E. Riter and C. V. Wheeler have bonded the Rover claim at Tintic to P. J. Donohoe, G. H. Robinson and others; the consideration is understood to be $45,000.

Bingham *Bulletin*: The Old Telegraph leasers had on the 19th shipped 1020 tons of ore since August 1.

Tribune: Notice has been served on Col. Heffron, manager of the Niagara Mining Company's property, and several others that no more ore would be received at the Mingo smelter from that source. The explanation accompanying the notice was that the lead market was glutted, that the warehouses were filled to their utmost and that until conditions were settled the smelter could not afford to invest in lead ore. Manager Heffron announces that the Niagara will shut down.

Col. Dorsey, manager of the Overland mine, Utah, proposes to build a mill of 150 tons daily capacity. The ore averages $8 per ton and there is plenty of it.

In the Herschell, at Mercur, the tunnel has advanced 600 feet, but it is not expected to encounter the ore body until 1000 feet have been run.

IDAHO.

The Bunker Hill has laid off 50 men and the Gem mine has been closed down and the pumps pulled out, throwing 70 men out of employment.

The Tip Top group of mines in Owyhee county have been sold by State Treasurer Bunting to W. S. McCormick, the Salt Lake banker.

Theodore Burback of Salt Lake and his associates have purchased for $100,000 placer gravel bars lying for three miles along Anderson creek, in Lemhi county, Idaho. All of the gold is exceedingly coarse, while not infrequently nuggets are found of the value of over $5. It is claimed that the bars throughout will average 65 cents per cubic yard.

MONTANA.

Inter-Mountain: It is reported that an English syndicate is figuring on the purchase of a number of claims on the porphyry dyke near Rimini, and if the deal goes through that a mill of 1000 stamps will be erected next spring to crush the ore. The dyke is an immense one and contains large bodies of ore, but generally of such a "streaky" nature that with few exceptions it has been found impracticable to work it at a profit.

The Black Sheep property in Beef Straight gulch, which was extensively worked by Butte parties three years ago, and which was condemned by experts, has passed into the control of W. A. Clarke, who will begin shipments at once to Butte.

W. A. Clark is negotiating for the purchase of the Mayflower No. 3 gold mine, near Whitehall. It is understood that Mr Clark has an option on the Mayflower for $150,000. The property is owned by S. R. Fair and Edwin M. Clark of Butte and C. J. Pruett of Whitehall. About $60,000 has already been taken from the mine during the two months it has been worked.

The Gold Hill Mining Company, limited, with twelve consolidated claims on Gold creek, is now organized and on a working basis. This camp is six miles distant from Jerome creek camp. Everything tends to show that the locations of the company are the sources of the big placer deposits of Gold creek, which have been continuously worked since discovery in 1864.

The Apex Consolidated M. Co. have recently struck a large body of ore in their new workings that has an average value of $10 per ton and is free milling in character, in addition to a large percentage of concentrates worth from $35 to $100 gold per ton. Thirty of the stamps out of the sixty in the company's mill are dropping night and day, crushing on an average 100 tons of ore every twenty-four hours.

Mining World: The Boston Stock Exchange has admitted the Anaconda Copper Mining Company of Butte to its exchange. It announces that the company has 1,200,000 shares of a par value of $25 each, and that it has paid but one dividend--that of May 1st, of $750,000.

The Alice Company is now dropping sixty stamps on ore from the mines of the company.

It is understood that as soon as the present supply of fuel on hand is consumed, the Montana Ore Purchasing Company will suspend operations on the Camp Creek properties.

The Golden Scepter Mining Company paid out over $80,000 the last payday, $60,000 of which amount was for labor. Five hundred men are on the payroll.

The Monarch group, consisting of the Monarch, Concentrated and British Lion claim at Neihart, has been sold to A. M. Henry and R. G. Wight in trust for the Florence Mining Company. The consideration is said to be $60,000.

WYOMING.

There is at the present time great activity along the many tributaries of the Big Laramie, and many prospectors are on the ground. A party of surveyors is engaged in selecting a route for a railroad to run from Fort Collins on a water grade into North Park. Several good placer properties situated on Independence mountain have recently been purchased by Colorado capitalists and contracts are being made to build the necessary ditches.

Hinman & Sheldon of Atlantic City have purchased the Downey stamp mill in the Gold Hill district, near Saratoga, and will remodel and refit it for the treatment of ores by the cyanide process. Four mines in the district are taking out ore and the new mill will have abundant product to work upon.

The Inter Ocean Mining Company has completed 1400 feet of fluming at its placer property on North Spring creek and is sluicing with considerable success. The gold taken out is very coarse.

SOUTH DAKOTA.

For the Homestake Co. the secretary's report shows that during the year the 100-stamp mill was in operation twelve months, the 160-stamp and the 200-stamp three months each. The three mills, aggregating 460 stamps, crushed 245,220 tons of ore, net returns $1,158,-457.66. The concentrates recovered from the tailings yielded $12,732.41, making the net product for the year $1,171,190.07; disbursements, dividends, $375,000; labor, $334,569.07; dead work sundries, $57,413.25; water, $48,-085.63; coal, $91,065.75.

Black Hills *Times*: Reports from Galena are that there are 150 men employed in the various mines and prospects. The Union Hill Mining Company will soon have the stamps in the smelter in shape to make a test run on the free-milling gold ores opened up during the past month on their Union Hill properties.

Wasp No. 2 Mining Company, under the present ownership, has produced $120,000, and has at the present time more ore in sight than at any time since first discovered.

COLORADO.

Cripple Creek *Mail*: A batch of talc from Oil creek was washed Monday at Gillett that went $50 to the ton. Heretofore the talc has been thrown away.

It has so far been found impossible to start the Peck mill at the Independence, and it may be necessary to make changes in the machinery, which will postpone its successful operation.

The Gold Geyser stamp mill and the Raven, Gold Geysers Nos. 1 and 2 lode claims, south of Cripple Creek, have been sold to Chicago parties for $35,000. A cyanide process will be added to the stamps.

The Ross & Hurd tunnel, in the southern spur at Raven Hill, has begun work with its new steam and air plant. The tunnel will be pushed in about 3000 feet, where it will connect with the Watson tunnel, and insure good air for both. The Watson is going diagonally into Raven toward Bull Hill. The plan of the operators is to continue 12,000 feet and come out of Bull Hill near the Victor mine.

Republican: Two tons of the talc taken from the new vein recently opened in the Lucky Guss, at Cripple Creek, ran $1840 a ton. The talc seam is from two to eight inches in width, and so far has been continuous in the working. Alongside lies two feet of a milling ore, the screenings of which run about $40.

At Saw Pit the Commercial group, composed of the Commercial, Jupiter, Lucky Jo, Florence L., Independence and Mayflower, has been disposed of by bond and lease to the San Juan Gold Mining Company of Milwaukee, Wis.

A rich strike of silver ore has been reported at Montrose.

The Silver Queen mine on Seaton mountain has been put in shape for mining. The lower levels are being drifted on, and it is reported by the management that a body of ore has already been cut, a test run of which returned $200 gold to the ton.

Drifting in the Lexington tunnel has been commenced and a contract calls for its extension of 200 feet to connect with the shaft, making it 800 feet in length.

A new concentrating mill is being erected at the mouth of Chicago creek by J. G. Roberts for the handling of all Clear creek ores. The capacity of the mill will be for 100 tons of crude ore a day, although, to commence with, but 50 tons will be treated.

At Gillett the Summit mill, which has lain idle for the past three months, has started to work on ore from the Summit mines from Bull Hill, beginning on 100 tons, and it is anticipated that there will be no further shut down of this mill this year. The mill employs 40 men, and has an annual pay-roll of $48,000.

The production of ore for July from the properties of the Golden Fleece Mining and Milling Company amounted to $35,773.44. The expenses for the month were $15,011.56, leaving a profit for the month of $20,761.88. The company has also purchased the Gov. Pitkin mining claim, which adjoins the Golden Fleece. The payments on this claim will have to be made on March 1 and Sept. 1, 1897. This could not be done and the 3 cent dividend continued without depleting their ore reserve, contrary to good mining and business prudence.

The general manager of the Argentum-Juniata Company gives the following figures in connection with the mine for the thirteen months ending July 1, '96:

Development work	5070 feet
No of sets (timbers) placed in the workings	661
Ground supported by the same	3192 feet
Diamond drill work	5661 feet
Ore shipments:	
Tons shipped	9,191.178
Average assay, silver ounces	83.71
Gross value	$493,349.05
Average value	$53.67
Freight charges	$63,750.37
Average per ton	$6.93
Smelting charges	$25,977.33
Average per ton	$2.83
Net cash returns for ore	$403,621.35
Average per ton	$43.91
Total contents of ore:	
Silver, ounces	764,443.43
Lead, pounds	166,188.00
Operating expenses per ton	$22.92
Net profit to company per ton	$20.99

The cost of the diamond drill work was 64 cents per foot. The average freight charges per ton, net weight, are $1.93 less this year and the average smelting charges per ton, net weight, are $2.15 less this year than last. The greatest expense was in the development, this accounting for 18.10 per cent of the whole. The cost of fuel was next being credited with 12.78 per cent and was closely followed by "hoisting and tramming," with 11.10 per cent. The total cost of running the mine for the thirteen months was $210,679.48.

ARIZONA.

Mining News: At Globe the company owning the mines is making extensive additions to its plant, among which is a 100-ton furnace.

The second payment on the Tucker mine, located about one and one-half miles northwest of Congress, has been made.

The *Oasis*: Development work on the Black Copper group, under bond to Fleming of Phœnix progresses in sinking a shaft on the Black Copper claim, now down 100 feet in ore.

Prescott *Courier*: The large tilting furnace of the United Verde Copper Company started up last week and made a successful run on copper precipitated from copper water.

At the Bland mine near Bumble Bee some very rich gold-bearing ore is being discovered. It is in streaks but the owner, Ex-Mayor Cushing of Omaha, expects soon to have enough developed to warrant the erection of a mill.

SOUTH AFRICA.

The July gold output of the Rand district was 203,873 ounces, an increase of 10,233 ounces over June.

At the Crown Reef, Johannesburg, results for July were: Number of days working 120-stamp mill, 29 days 11 hours; crushed by 120-stamp mill, 17,431 tons; yield in smelted gold from 120-stamp mill, 6508 ounces; yield in smelted gold from 120-stamp cyanide works, 4503 ounces; total, 11,011 ounces; working expenditure, 120-stamp mill and cyanide works, 17,431 tons milled; to mining, transport, milling, cyanide, general charges, maintenance and mine development, £23,154; revenue--by gold account—6508 ounces from 120-stamp mill, £22,299; 4503 ounces from 120-stamp cyanide works, £14,009; total, £36,308; profit for month, £13,154; revenue per ton crushed, £2 1s 7.91d; cost, £1 6s 6.80d; profit, 15s 1.11d.

AUSTRALIA.

The Mount Lyell Mining Company's head office at Melbourne reports that from June 25th to June 30th 2588 tons of crude ore--averaging about 6 per cent copper, 6 ounces 5 dwts. silver, 3⅛ dwts. gold per ton—were treated, producing 224 tons converter matte containing 114 tons copper, 9373 ounces silver, 320 ounces gold, and 129 tons first matte containing 28 tons copper, 1489 ounces silver, 78 ounces gold, which have yet to be reduced into converter matte, all worth £9975 at present London quotations. Cost of mining and smelting 2588 tons, £2555 13s, equal to 19s 9d per ton ore. Further costs per ton 12s 3d (it will be necessary to produce blister copper from converter matte) inclusive of all charges, treatment, shipment, realization in Europe, making present estimated total expense £1 12s per ton ore, leaving estimated profit £5884, equal to £2 5s 1d per ton of this class ore. Metallurgist reports pyritic smelting complete success.

The reports of the Broken Hill Proprietary Co. of New South Wales for the half year ending May 31st give some interesting data of that great enterprise.

The available quantity of payable oxidized ore averaging 15 ounces of silver and 12 per cent of lead was calculated at 1,250,000 tons which is a considerable increase on any previous figures. An estimate of the extent and quantity of the known and proved bodies of sulphides was given as 2,019,000 tons; assaying on an average 18.5 ounces silver, 24.5 per cent lead and 21.9 per cent zinc. A further quantity of 600,000 tons is considered to be within these limits, but its extent has not yet been fully determined by the present prospecting operations.

It is the intention of the management to erect a concentration plant of 5000 tons weekly capacity, in order to obtain a suitable product from the sulphides for smelting in conjunction with the remaining oxidized ores. The plans, which provide for an enlargement up to 10,000 tons, have been prepared, and the work of erection will shortly commence, and should be completed before the end of the year.

The following figures are given showing work done:

Total ore raised		277,881 tons
" Crosscutting and driving		8819 feet
" Rises and winzes		1,479 "
" Shaft sinking		192 "

The whole of the products from the mine now pass through the reduction works and the publication of future yields will be based in the output of that establishment being estimated and announced every four weeks.

The total amount of dividends paid since organization is £6,040,000. The amount expended in construction with the formation of the company has been £710,431.

The expenditures on working account for the six months was £466,992 and the gross profits for the same time £281,735. The amount paid in dividends was £288,000.

The water used at the mine for various seasons has been as follows:

	Gallons.
From the Company's dams	10,980,000
Acacia Basin	3,061,200
Boken Hill Water Supply	25,497,000
Total	39,539 100

Horses have lately been introduced underground for hauling trucks, and, when the requisite sidings and other facilities are complete, a substantial saving may be expected.

Following is a statement of gross quantity of ore treated, showing silver and lead produced:

	Gross Ore Treated.		Fine Silver Produced.	Lead.
Mine Furnaces	120,484		2,597,218	9,357
Port Pirie Furnaces	38,478		701,378	1,836
Refinery Furnace (Port Pirie)	7,277		157,907	126
British Co.'s Furnaces (Broken Hill), to Jan. 30, 1896	7,810		146,162	463

Totals		4,107,578	11,958	284

The refinery has treated 12,580 tons of silver-lead bullion (including all bullion produced to 28th May) yielding:

Product.	Fine Silver, Ounces.	Lead, Tons.	Gold, Ounces.
In Silver Bullion	3,488,179	....	.....
In Dore Bullion	721,006¾	....	3,817.345
In Lead, China Bars	.....	7,444	.....
In Lead, Ordinary Bars	.....	4,367	.....
In Antimonial Metal	.....	380	.....
Totals	4,209,185¾	12,191	3,817.345

The gross receipts of the Mount Morgan Company during the past year were £578,677, out of which £300,000 was paid in dividends, £6154 in royalty, and £11,734 added to the bullion reserve.

At the Mount Morgan mine, Queensland, results for the month of July were: Tons chlorinated, 9786; gold returned, 13,090 ounces.

Coast Industrial Notes.

—The farmers of Monterey are pledging acreages for the cultivation of beets in order to secure the erection of a sugar factory.

—Five years ago not over 20 carloads of refined salt were shipped out of Utah. Now the business amounts to 1500 carloads annually.

—It is proposed by the Sunset Telephone Company to organize a system between Yuba City and Colusa, via Sutter City, Meridian and West Butte.

—The sugar mill at Alvarado began a five month's run last Tuesday with about 100 men. The acreage of beets available this year is 3800 acres against 3000 for last year.

—The Grizzly Bluff creamery, at Ferndale, the largest in Eel river valley, with a capacity of 2000 pounds of butter and as much cheese per day, was destroyed by fire last week.

—The receipts of lumber at the port of San Francisco for the first six months of this year aggregated 194,630,299 feet, as follows: Pine, 125,995,673; redwood, 64,030,482; spruce, 4,418,884; cedar, 163,000; maple, 8,160; ash, 14,100.

—The owners of the electric power and lighting plant at Sonora, Tuolumne county—Messrs. Crooks & Jarboe—propose to expend $50,000 in improving the plant and have decided to furnish the power needed direct from the river.

—The Electric Power Company of Grass Valley are enlarging their dam on the South Yuba and increasing the capacity of their flume. Their connections have been made with the new plant to run the Gold Hill mine, which is about ready to start up.

—Thomas S. Bullock, the New York capitalist, who proposes to run a railroad from Stockton into the mining region of the Sierras, is in that city. Nearly eighty miles of rails have arrived for the purpose. It is not certain to what point it is proposed to run the road.

—A representative of Claus Spreckels has been interviewing the farmers in the neighborhood of Sacramento with a view to inducing them to make tests of their ground to determine whether it is suitable for raising sugar beets. He says that if 30,000 acres of good ground could be obtained for the purpose and the farmers would agree to plant, a factory would be started by Mr. Spreckels.

—The present output of the Los Angeles oil wells is estimated at 50,000 barrels per month. There has been an increase of consumption, the surplus has decreased and the market has become stronger, prices ranging from $1 to $1.15 per barrel, paid producers at the well tanks. Eight months ago no oil was being produced west of Belmont avenue, and now nearly one-half the entire product comes from that district. Nearly all the wells in the old district are falling off.

—Grocers handling filled cheese are being notified by the internal revenue office to get their product out of the way before next Friday, or to have it stamped and pay the tax on it before that day. The recent enactment of Congress on filled cheese goes into effect at that time. The stuff will have to pay a tax of 1 cent a pound. The retail dealer must pay an annual fee of $8. The cheese must be stamped on top, bottom and around the outside with black letters, and, in addition, the grocer or retailer must display a sign with letters 6 inches long, "Filled Cheese Sold Here." Failure to have the cheese stamped and marked, or failure to pay the annual fee before that time, renders the dealer liable to a fine of $50 and the cheese to confiscation.

Personal.

JOHN D. LUDWIG has returned to Mariposa county from the East.

JAMES H. TIBBETTS, of Calaveras, who went to South Africa as a mine manager about 18 months ago, is on his way home.

LOUIS P. DEVAT, of Paris, one of the owners in the Flagstaff quartz and Clark creek placer mines in southern Oregon, has come out to visit the properties.

A. B. WOOD, who was one of the men who started Leadville and who is interested in the copper mines of Michigan, is here with a view to looking for California investments.

W. S. EDWARDS, who has been for several years general manager of the Silver King mines in Calico, recently arrived from London and left last Saturday for Guatemala, to inspect some coffee plantations and with a view to settling there.

GARDINER F. WILLIAMS, manager of the De Beers diamond mines in Kimberley, South Africa, was reported to have given up his position with the intention of coming to California to remain. This is not true. Mr. Williams will remain here a few weeks visiting his relations in Oakland and then return to Kimberley.

Recent California Mining Incorporations.

Draper-Whitt G. M. Co., Oakland; capital stock, $300,000, $15 subscribed.

Gold Ledge Consolidated Mining Company, Santa Rosa, Sonoma county; L. F. Hodge, H. L. Tripp, A. J. Burnett, A. W. Arnold and M. V. Vanderhoof, all of Santa Rosa; capital stock, $500,000.

Yellow Metal Mining Company, San Francisco, capital stock, $1,000,000, $35,000 subscribed; H. O. Sterns, W. Rutledge, J. S. Eastman, A. M. Taylor, A. E. Williams, W. T. Bell, L. Thors.

At the annual meeting of the California Association of Civil Engineers on the 21st inst., at their rooms in the Academy of Science building, S. F, the following officers were elected for the ensuing term: President, Fred T. Newbery, San Francisco; vice-president, L. J. Le Conte, Oakland; directors—George F. Allardt, Oakland; Charles D. Marx, Stanford University; Herman Kower, University of California; Carl Uhlig, San Francisco; George L. Nusbaumer, Oakland.

Commercial Paragraphs.

THE California Electrical Works has this week established itself in new and commodious quarters, 409 Market street. Five floors and basement with frontage of 30 feet and depth of 150 feet will doubtless give the company room to carry on its business. The company is prepared to contract for the building of power transmission and electric lighting plants on any scale. The business management of the house is in the hands of G. D. Greenwood whose knowledge of all branches of electrical work is thorough, and who has a record for push and enterprise.

FROM Fraser & Chalmers, Chicago, are received circulars 1 to 15 and catalogues 24, 46, 32, 36, 51 and 52, covering chiefly further data of the success of the Bridgman sampler, the introduction of the Otto aerial tramway, already firmly established in European favor, the introduction of a dry placer miner (Woods), which has given good results, the Alsing pulverizer for fine grinding on gold ores, enamel, etc., a record test of one of their triple expansion Corliss engines, a preliminary circular on a new line of small steam hoists, a stamp-milling record by their Alaska-Mexican battery, and reports of saving and results in the use of Riedler compressors and pumps, Comet adjustable crushers and Browne hydrometric sizers in connection with Frue vanners.

Recently Declared Mining Dividends.

Isabella mine, Colorado, $23,500, Aug. 25th.
Ontario mine, Utah, $15,000, Aug. 31st.
Silver King mine, Utah, $37,500, Aug. 7th.
Slocan Star mine, B. C., $100,000 on Sept. 1.
Utah mine, Utah, $2000, Aug. 10th.
Galena mine, Utah, $5000, Aug. 10th.
Gold Coin mine, Colorado, $20,000, Aug. 10th.
The Little Jessie, Yavapai county, Arizona, $5000, Aug. 25th.
Homestake Mining Company, Deadwood, S. D., $31,500, Aug. 25th.
Wasp Mining Company, Deadwood, S. D., $20,000, Aug. 18th.
Mammoth Mining Company, Utah, $20,000, Aug. 25th.
Helena & Frisco Mining Co., Helena, Montana, four cents per share, $20,000, Aug. 22d.
Bullion-Beck and Champion mine, Utah, $15,000, Aug. 6th.
Deadwood-Terra M. Co., South Dakota, 50 cents per share, $100,000, Aug. 20th.

Obituary.

JOHN C. ARNOLD, United States Surveyor-General of Oregon, died at his home in Portland last Monday.

CAPT. J. W. PLUMMER, well and widely known, died in London on the 19th inst. He was manager of the DeLamar, Idaho, mine and a skillful miner. The mine that he managed crushed 4,261 tons ore last month, realizing $61,215, and a net profit of $19,074.

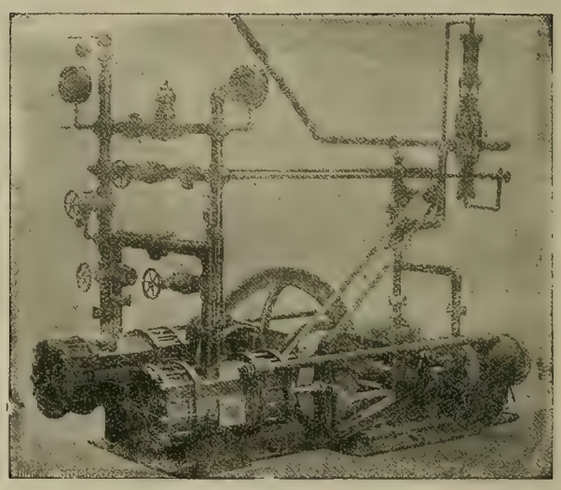
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

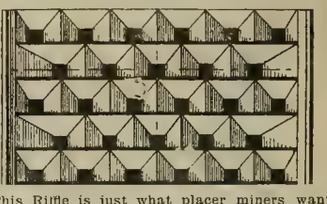
PAYNE'S
PATENTED
GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 27, 1896.

Jobbers, as a rule, are astonished at the footing of sales so far in this month. Notwithstanding the low average of values of goods handled, still they aggregate larger in value than in the corresponding month of last year, and as for that, for several years past. While the consumption demand does not show any increase from the agricultural sections that from the gold mining districts on the coast show a most decided increase. Had it not been for the revival in gold mining business interests in this city, and as for that, on the coast, would have suffered very severely owing to the low and unsatisfactory prices that have ruled for farm products. With iron workers business continues good, larger than at this time last year. So far as we can learn there are not many new orders for machinery, structural and railroad materials, but those in hand will take sometime to clean up.

The local money market is said to be working close, with a fair call for funds for crop moving purposes. The closeness of the market is due more to banks hoarding money than from any other source, therefore it is largely artificial. The receipts of gold from the mines aggregate over $2,000,000 a month which goes into general circulation and helps to relieve the situation. The call for funds for both business and speculative purposes is light which shows a fair degree of ease in business circles. At the East the money markets are still working close but this will be relieved by imports of gold from Europe which, it is stated, will aggregate from $10,000,000 to $20,000,000. The demand is increasing for crop moving purposes. The later call is taking increased quantities of standard silver dollars. Over $2,500,000 went out for the four weeks ending with August 15th. The balance of foreign trade is largely in favor of the United States as will be seen by the following: For the seven months ending July 31st the imports of merchandise into the United States aggregated in 1896, $421,583,123 against $464,625,876 in 1895; showing a decrease of $43,042,753. The exports of merchandise during the same period of time aggregate in 1896, $512,326,732 against $443,406,784 in 1895; showing an increase of $68,919,948. The exports over imports for the seven months of 1896 aggregate in value $90,743,609.

Refined Silver, per oz., 1000 fine	66⅝
Mexican Dollars	53@53½c

Eastern exchanges are nominal.

SILVER.—The market sold down but towards the close it is stronger both at home and abroad. The decline is not due to increased productions but it is stated by Eastern exchanges to have been brought about by large offerings from this side to Europe, and as the demand abroad is slack buyers bid down. So far the free coinage agitation has had an unfavorable effect on silver bullion. In our market and also at the East the export demand is light.

Pixley & Abell report exports of silver from London to India, China and the Straits for the year to August 1st as follows:

	India.	China.	Straits.	Total.
1896.	£2,175,578	£574,413	£545,386	£3,295,677
1895.	2,251,580	1,100,767	512,703	3,865,050

MEXICAN DOLLARS.—The demand continues light, which usually obtains when silver is down. There is a good supply on the market.

COPPER.—The market at the East has fallen to still lower figures. At the decline there seems to be a slightly better export movement. It is stated that consumers abroad have their temporary wants well supplied, but will begin to go into the market more freely towards the close of September. If this proves correct, an improvement in prices can be looked for. The demand in this country is still light and not much of an increase is looked for until November.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is essentially unchanged.

Domestic trade, per flask	36 00

For export quotations are nominal, but less than for home.

LEAD.—The local market favors buyers. At the East low prices continue to be reported with a light demand ruling. Stocks abroad are excessive and markets heavy.

Our market is quoted as follows:

Pig	—	@	3 65
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50
SHOT.—The demand will soon start up again; at present it is dull.			
Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes, " "			1 45
Buck, Balls and Chilled, do, " "			1 45

ANTIMONY.—The demand is fair, with the market steady at 7¾@8¼c in a jobbing way. New York mail advices quote 7¾@7½c for Cookson's, 6½c for Hallett's and 6½c for Japanese, from store.

TIN.—The market continues to rule in buyers' favor both on this coast and at the East in sympathy with lower prices abroad for pig tin owing to lower prices for silver.

The market is quoted as follows in jobbing lots:

Pig, per lb	14
Plate, I C coke, heavy, per box	$4 10@ —
" " " light, "	4 00@ —

BORAX.—There is a good demand for shipment East.

Refined, in car lots	6⅜
Refined, in sacks	5⅜
Powdered, in car lots	5¼
Concentrated, "	5⅝

POWDER.—The market is practically unchanged.

The market is quoted as follows

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—Some shading is reported in sympathy with lower offers to arrive and for shipment. The consumption is reported to be fairly free.

COAL.—Some cutting is reported for spot, to arrive and for shipment. Offerings of Pacific coast coals are liberal, which operates against foreign.

COKE.—The market is quoted as follows:

Gas Companies'	—	@	—
English, to load	8 00	@	—
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	—
Cumberland	—	@	—

LUMBER.—There is a continued good export demand, but for home consumption the call is light.

Redwood, Fluming	17 00	@	—
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—Buying continues in a hand-to-mouth way. Dealers carry light stocks, fearing a decline in prices.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Aug. 27, 1896.

The market has been devoid of any feature deserving of special notice. The fluctuation in prices have not been more than about 5 per cent. Why the market has been kept in this condition causes comment with outside operators, but no satisfactory reason has been given, except that inside operators are too busy with the silver question to give attention to mining shares and therefore instructed their brokers not to do anything outside of keeping the market from falling to pieces. Another set of operators say that the blackboard prices are due to a desire of insiders to disgust outsiders and get them to sell under assessment scares, bear points of lower prices and not have anything done at the mines calculated to cause buying by the latter. It would seem as if the latter is being done, which, if correct, gives color to reports that the situation at the mines is very much better than the true inside moneyed men wish to have known. That there seems to be a regular genuine freeze-out game going on can not be denied, for there are no fluctuations, while the market is made to look sick and heavy, as if ready to break at any moment. Heretofore when it hung as at present, prices were sent lower before an upmove. The setback was made to get in all the margins possible; but now margin accounts are light, for buyers have purchased more for cash than before known. It is these the inside appears to want and which they have reason to think can be had by assessments and no favorable official reports from the mines calculated to cause holding. As usual, in some of the mines they are not extracting ore and are either stopping work or else are laying off men, claiming there is no water in the Carson river to run the mills. At the season of the year when there is water there is no ore, and when there is ore or a chance of getting it there is no water. This makes shrewd operators think it is shares, and not ore, that are wanted. It is the current belief that after election things will change for the better, for by that time the public will have considerable less shares and conditions will be more favorable for a deal. While this is the general belief, there are some who think that a small upmove will come first, to be followed by quite a setback. Which is right, or whether both are slightly correct or wrong, the writer can not say, but it does seem as if some of the shares at present low prices would do to buy for higher prices later on. The market never fails to rally and make quite an advance after each depression and low prices.

The news from the Comstock mines is of an unimportant character. The work to which public attention is attracted is not calculated to result in anything of much value; or if it does, it is not at all unlikely but the information will be withheld for stock-jobbing operation. This has been the case heretofore with insiders, and it is reasonable to conclude they have not had a change of heart. In Alta the wrize continues in ore as they sink on the Keystone ledge. Overman is still taking out a few tons of ore a week, but no mention is made in official letters of a strike or of the general character of the work that is being done. Seg. Belcher and also Belcher are raising ore each week, but no information is given as to where they are working or the nature of the work. Possibly this will be done after assessments have been collected. In Crown Point they have laid off men on the specious plea that there is no water in the Carson river to run the mill so as to crush ore. This is an indirect way of admitting they have ore which will pay to extract and mill. The rainy season will be here soon. No news comes to hand from Yellow Jacket. In Confidence they are still fooling around the ore which they struck and skirted some time ago, but it looks as if nothing will be done with it until the assessment is off the shares. The same remarks are applicable to Challenge. The long west crossdrift in Con. Imperial run jointly by Challenge, Confidence and Con. Imperial, is being extended slowly. It looks as if they fear that the west lode will be struck too soon if work should be pushed. The No. 3 crossdrift to the west is also being extended slowly. Official letters from Alpha do not report any material change. So far they do not report re-finding the ore struck to the west some four or five years ago in the level above where they are at work. From Bullion nothing new comes to hand and nothing expected until the assessment is off. In Potosi and also Chollar they are working on the same levels heretofore published. The former is not extracting ore, but the latter is taking out over 100 tons a week assaying over $25 a ton, which assists in paying expenses. In Hale & Norcross the work is of an exploiting character, and on the levels heretofore published. A few tons of ore are raised each week. In Savage the work is on the same levels and direction published the past three weeks. The joint east crossdrift from the Bonner shaft is being extended by Gould & Curry and Best & Belcher. Some think well of this work. The work in Con. Virginia which seems to attract attention is that to the east on the 1650-foot level. This is quite a gamble and may turn out much better than the many believe. That ore will be struck cannot be doubted, but how much and how high a grade no one knows and therefore the gamble. The work at other points in the mine is on the same levels they have been working for some time. The ore raised the past week was over 140 tons, assaying over $45 a ton. They are milling ore, but the battery assays are not as high as it was thought they would be, judging from the car-sample assays. The work in Ophir is still on the central tunnel and 1000-foot levels and to the west. In Mexican work is still to the west on the 1000-foot level. Union has levied a 20-cent assessment. It is said that if this drives in enough shares they will be able to find ore. The work in this mine and also Sierra Nevada is unchanged, with none expected until the assessments are off.

The Dazet mill, under the management of James Cronan, worked for the Hale & Norcross Mining Company during July, 1896, 238½ tons of ore which yielded $5,044.30 in gold coin. His official statement shows that the mill saved 100 9-10 per cent of the battery assays and 77 3-10 per cent of the feeder assays. The total amount of gold in the 238½ tons, as shown by the battery assays, was $2,146.50 or $9 per ton, but as the United States mint at Carson returned the company $3,577.38 or $15 per ton in gold it follows that the battery assays do not show all the gold contained in the ores. If $1430.80 can be saved in gold alone from 238½ tons of ore as between battery assays and actual yield then other mill men on the Comstock should be more careful in the future to see that it be done for their respective companies. Under the new management the Hale & Norcross Company has made several reforms in the interest of shareholders and set an example in other directions deserving of following by other companies.

From the Brunswick lode there is nothing of special interest to report. The work in Occidental is about the same as given last week as is that in Chollar, Hale & Norcross, Savage, Gold & Curry and Best & Belcher. In Chollar it is stated they will raise the 6-foot ore found on the 300-foot level. In Hale & Norcross they will soon be down to the 400-foot level. Drifting south will be commenced in about ten or fourteen days. This work, it is expected, will give good results. An unconfirmed report is on the street of an improvement in the winze.

From the Bodie district there is nothing new to report. The work is on the same levels and directions heretofore published. Some ore is being found raised in Bulwer, Bodie and Standard. Active exploiting is being done. The drift run by Mono from the Bodie 400-foot level, is being pushed ahead towards the Fortuna ledge. There is some talk of the Tuscaroras come to the front again.

The market was dull with the brokers, like small boys passing through a graveyard, making a noise to keep their courage up. The only strong stock was Occidental. It is expected that a joint crosscut will be started soon by Savage and Hale & Norcross on the 300-foot level Brunswick lode. Good results are looked for.

The following illustrates the changes of the week:

Mines.	Aug. 20.	Aug. 27.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

The Jno. G. Morgan Brokerage Company,

BANKERS

and.....

BROKERS,

1015 Seventeenth St., Cooper Blk.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

An experienced and practical mining engineer will be open to engagement in a few weeks; best of references, including present employers. At present am superintendent of a mine; am a mechanic, surveyor and assayer. Address "Superintendent," care of Mining and Scientific Press.

An Ex-Supt. and Mining Engineer,

Lately returned to California, desires a situation. Best of references. Address No. 37, this office.

SITUATION WANTED

By an experienced Amalgamator and Mill Man who thoroughly understands his business. References furnished. Address W. A., this office.

Mining Engineer and Metallurgist,

Graduate of Lehigh University '95, desires a position with reliable mining company, United States or Canada preferred, but will go to Mexico.

Address LEHIGH,

Care Mining and Scientific Press.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 18, 1896.

566,144—INVALID'S BED—J. B. Young, Pasadena, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DRAFT REGULATORS.—John S. Fox, Oakland, Cal. No. 566,073. Dated Aug. 18, 1896. This invention is especially designed to be used in connection with heating furnaces having a number of hot and cold air passages leading to various rooms to be heated, and in which it is necessary to regulate the supply of air to any one room and proportion it properly. In such apparatus it is found that the hot air will, when the fire is started, often go to certain rooms, while the others will be left with little or no supply for a long time, and it is difficult to remedy this matter without visiting the rooms and ascertaining the condition of each one, especially in school-houses having many large recitation rooms to be heated by hot air. The invention consists of an arrangement of dampers, a propelling wheel driven by the current of moving air, and connections between the dampers and the wheel shaft whereby the movement of the wheel will operate to open or close the dampers as may be necessary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. A. Keefer, in the Alcyone Mine, near San Andreas, Calaveras Co., to deposit tailings in San Domingo Creek, and from J. R. Sears, in the French Claim, near Indian Diggings, El Dorado Co., to deposit tailings on the bank of Clear Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 14, 1896, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from George Beattie, in the Beattie and Parsons Mines, near Georgetown, El Dorado Co., to deposit tailings in Big Canyon Creek, and from Richard Phelan, in the Hilda Mine, near Sierra City, Sierra Co., to deposit tailings in a ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on August 31st, 1896, at 1:30 P. M.

Assessment Notices.

BELCHER SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of August, 1896, an assessment (No. 55) of twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 30th day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
C. L. PERKINS, Secretary.

Office—Room 37, third floor, Mills Building, N. E. corner Bush and Montgomery streets, San Francisco, California.

JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, on Little Jamison Creek, near Johnsville, Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors o the Jamison Mining Company, held on the 22nd day of July, 1896, it was resolved that any stock upon which the assessment shall remain unpaid on the seventh day of September, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, September 28th, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California; location of works, Kelso, Cowlitz county, Washington.

Notice is hereby given that at a meeting of the Board of Directors held on the 24th day of August, 1896, an assessment (No. 7) of Three Cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market Street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the twenty-fourth (24th) day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
E. D. FARISH, Secretary.

Office—No. 632 Market Street, Room 5, San Francisco, California.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
220 Market Street . . . . . San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners
By C. W. Moore. With numerous illustrations.....$4 75

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men In cloth, postpaid.....$3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standare authority of the world in Copper Smelting. Profusely illustrated.....$5 0

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. This new and important book s on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dumps; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

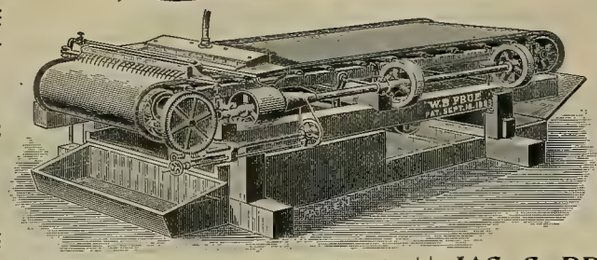
Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

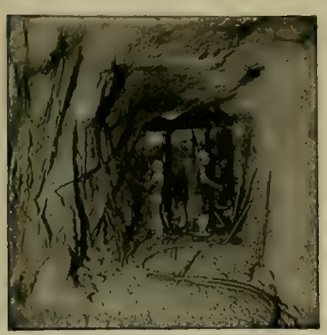
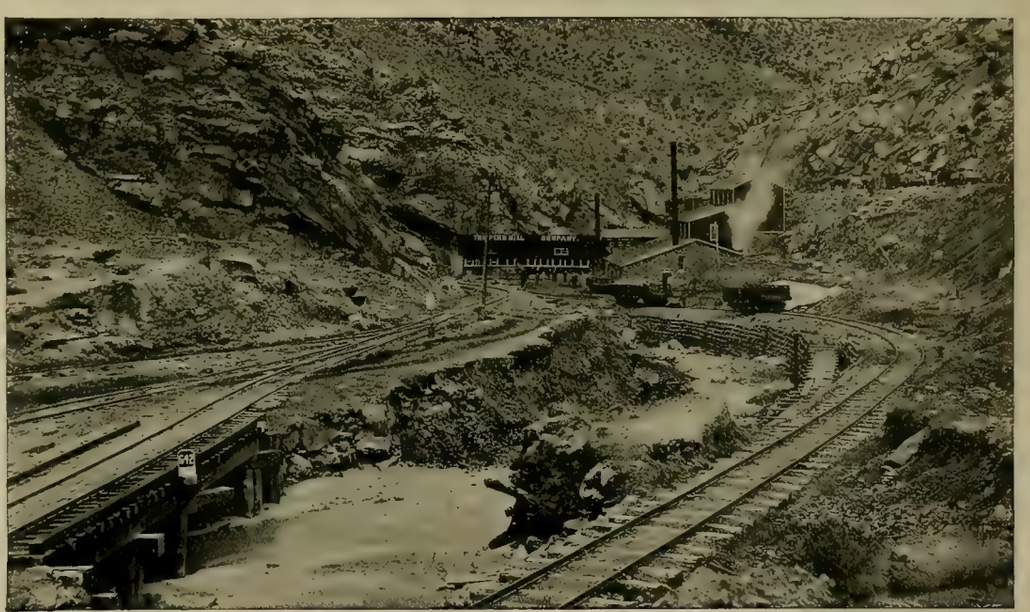
Handsome and Effective Advertising.

This is the age of advertising. Whether it be a wheelbarrow or a bicycle, a dry washer or a steam engine, a mine or a railroad, it can best be served by judicious advertising. We of California have not yet discovered that, or knowing it do not act upon it. Other communities have. Realizing that the simple possession of a good thing does not imply general knowledge of the fact, our sister commonwealths are apprising the world of what they have for sale, and are using printers' ink freely. In these days of the prominence of the mining industry, when that form of commercial business leads all others, it is to be expected that mining receives the greatest quantity and secures the finest forms of advertising. In Colorado, Utah, Montana and Washington the railroads are doing a good deal to advertise the mining resources of the country from whose advancement they expect to derive business and whose prosperity is in exact proportion to their own. The railroads running through those States are issuing splendid specimens of the printer's art, calling attention to the mineral resources of the country they traverse, and incidentally, the ease of access afforded by the particular road described. It is to be said that for every line advertising the railroad there is a page advertising the country through which the railroad runs. The contrast between this liberal policy and the California roads is marked. So far as advertising goes one would never know from a Central Pacific or Southern Pacific or A. & P. publication that there was such a thing as a mine in California. This, however, is characteristic. It has, apparently, been the constant custom if not the policy of the railroads centering in San Francisco to ignore all efforts at advertising the State's mineral resources. The idea seems to be that while occasionally nuts, oranges, figs, grapes and lemons are given a word of mention in railroad literature, the fact that California is the greatest gold field and leading gold producer in the world must be studiously and sedulously suppressed.



BREAST OF NEWHOUSE TUNNEL, ONE MILE FROM ENTRANCE.

LINCOLN MINE, IDAHO SPRINGS.



THE PENN MILL, NEAR BLACK HAWK.

PROSPECTING NEAR LEADVILLE, COLORADO.

In striking contrast to this apathy and mistaken custom is the action of the Colorado railroads. They realize that their profit and continued prosperity lies largely in the development of that State's mineral wealth. They understand that whenever a mining property is developed, or a new camp opened up, that means big freight and passenger business, and, accordingly, they let the world know what they have. In these days of brilliant advertising few forms of that art have received finer exemplification than in the literature issued by the Colorado railroads this summer. Apart from some slight exaggeration and overstatement there is so manifest a desire to exhibit and set forth the mineral resources of the State in a way calculated to interest and impress the general reader that the few misstatements can be passed over in silence. So far, one of the finest that has fallen under the writer's observation is a brochure, "Colorado's Gold," superbly produced by B. L. Winchell, the general passenger agent of the Gulf Road and South Park Line, Denver, Colorado. Some of the illustrations are herewith produced. The

TABLE OF CONTENTS.

ILLUSTRATIONS.—Breast of Newhouse Tunnel, One Mile from Entrance; Lincoln Mine, Idaho Springs; The Penn Mill, near Black Hawk; Prospecting near Leadville, Colorado, 189. The Cradle Being Filled with Logs; The Raft in Tow of Tug with River Steamer to Assist in Rounding Turns in River, 192. American Placer, Newlin's Gulch; Newhouse Tunnel, Idaho Springs; Interior of Mineral Palace, Pueblo, Col., 193.

EDITORIAL.—Handsome and Effective Advertising, 189. Possession vs. Location; The University and Mining; Overcapitalization of American Mines in London, 190.

ELECTRICAL PROGRESS.—Kern River Electric Plant; Danger from Electric Current; A Growing Business; A New Electric Telegraph, 196.

SCIENTIFIC PROGRESS.—Conductivity of Metals at Low Temperatures; A Synthesis of Humanity; Microscopic Internal Flames Induces Fracture in Steel; Measuring the Velocity of Projectiles, 196.

MECHANICAL PROGRESS.—Use of Compressed Air in Foundries; Cantilever Bridges; How Mineral Wool Is Made; "Use of Tactorium in Europe," 197.

PRACTICAL INFORMATION.—Electing a President; Crude Turpentine; Prospecting for Minerals in the Province of Tse-Chuen; Money of the World; How Piling is Driven in Bavaria; Position Reversed; Cheese a Most Valuable Food, 197.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 198-9.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 210.

MISCELLANEOUS.—Concentrates, 191. Ocean Transit of Timber; Activity in Mining Enterprises, 192. The Free Coinage of Gold, 193. Vein Walls; The Accumulation of Amalgam on Copper Plates, 194. California Mines and Miners, 195. Coast Industrial Notes; Recent California Mining Incorporations; Obituary; Commercial Paragraphs; Recently Declared Mining Dividends; The Commercial Mines; Personal; Pateuts; Notices of Recent Patents, 202. Books Received; Power from Small Mountain Streams, 203.

Possession vs. Location.

Mention was made last week of the ruling of the Supreme Court of this State in the Altoona case to the effect that one may obtain full title to a claim by possession for five years without regard to formal location. The language of the decision was not as clear as it might have been, but the same thing has been well stated by Judge Beatty in the United States Circuit Court in his charge to the jury last January in the case of the Little Emily Mining and Milling Co. vs. William S. Couch et al., and as it is a matter of considerable importance we give a portion of his charge to the jury:

You will remember that the plaintiff does not rely absolutely upon a paper title, but rather upon a title by possession. Its location of the Eureka and Laura lode is evidenced by the original location notices. It has, that far, a claim of title. It claims under color of title, the claims having been located quite a number of years ago, and notices of location of those claims have been produced; but, generally, its title is based upon a title by possession.

I instruct you that a title by possession may be good in a mining case. It may become an absolute title. Congress, by section 2332 of the Revised Statutes, or by the act of, I believe, May 10, 1872, provides that a party may get a patent for a mining claim held simply by possession, providing that the possession has been of such a time as is provided by the statutes of the State. It gives a party title through possession.

In this State the statutes provide that one who has had a certain kind of possession of property—real estate—for the period of five years, has a title to the property, and the law of Congress applies to that. If one has the peaceable possession of a mining claim for a period of five years, that gives him the right to the title to that property, and the Government would issue him a title to that property—that is, a title in pursuance of section 2332.

Where there is a contest for a patent, even, they give title to the party who has held adverse possession for five years under a claim of title.

Judge Beatty in the same charge explained the position of alien locators of mining ground, claiming that only the Federal Government may raise this question on applications for patents. There are claims in this State which have been located a long time ago by aliens, and for which the owners would long since have asked for patents but for that objection. Their titles, however, are good except for that purpose. On this point, Judge Beatty said:

As a general rule, it is true that citizens only of the United States can locate mining claims, but it has been held by the Supreme Court, which is of course our guide, that that is a question that can be asserted or claimed only by the Government. In a contest between individuals, as in this case, which is an action of ejectment, that question does not arise; but when a party applies for a patent, the Government is interested, and in a case of that kind the citizenship of the parties must be shown before the party would be entitled to a patent; but this is not an action for a patent. It is an action of ejectment for the possession of that ground, and I instruct you in this case that that question cannot be considered. It is only for the Government to make that objection on the ground of non-citizenship.

Overcapitalization or American Mines in London.

The old habit of overcapitalization that has so often brought American mines into bad repute is growing up again in London. The trouble has seldom been that worthless mines were offered, but that good mines were placed for many times their real value. In the nature of things it is hard to place a mine on the London market at its real value. The greed of promoters and the customary high expenses of their art as practiced, and the large commissions or profits demanded by all concerned, all tend to place a fictitious value on good properties offered.

We have received from a correspondent a letter in which he says:

"I beg to enclose you the prospectus of a property offered in the London market which I would consider high priced at $150,000, but they ask £150,000 or $750,000. It is a batch of old mines situated in Montana, with an old 10-stamp mill and some 25,000 tons of ore in sight which they say will realize £32,000 when worked." The prospectus of the Gold Prize mines in Deerlodge county, Montana, goes on to relate that £130,000 is to go to the vendors and £20,000 is to be used as a working capital. Of this it is safe to say £6000 would be required to build a mill, leaving £14,000 for other expenses and a working capital. Any one acquainted with the method of expending large sums in administrating by English companies would understand that very little would be left to develop enough more ore than the £32,500 worth to pay back the capital it is proposed to invest. As usual, there is in the list of directors the customary man of title, the banker, and well-known mining engineer and the man who "is to join after the allotment."

But then the overcapitalization is not the only trouble. In these cases where investors show bad judgment in placing their money there is apt to be bad judgment in managing the properties. A number of years ago Ballard & Martin took hold of the New London mine in Amador county and expended over $300,000 in developing it. Hoisting works and a mill were erected and a shaft sunk, but while a large body of ore was opened up it was not found to be of high enough grade to pay to work. They pulled up their plant and went over to the Rawhide, giving the New London back to the former owner. Shortly afterwards a bond on it at $10,000 was secured from him by people who in turn handed it over to Harpending of "diamond swindle" fame for a trifling advance. Harpending had the mine placed on the London market with a capital of £200,000. The company began operations by having an expensive 40-stamp mill erected under a contract with a time penalty. Then they began the erection of hoisting works and finally started in to pump out the mine and look for ore. When down some 400 or 500 feet—not half as far as Ballard & Martin had sunk—they gave up the enterprise. The property, including the new mill, was sold for the benefit of a mortgage and bid in for Harpending for less than $5000. In this case whatever the Englishmen who lost by the venture may say of the manner in which they were taken in cannot certainly excuse themselves for their own wretched mis-management.

The *Engineering Magazine* for September says on this subject: "But the dissatisfaction which has too often attended the investment of British capital in enterprises in this country is something for which Americans are not always and altogether to blame. Faulty judgment in placing the money, and unwise operations following, have had their contributing influence, and for these our English cousins must accept the blame."

The University and Mining.

It seems a little singular, considering the millions of treasure, the vast range of industry opened to the people, the wonderful impulse given to agriculture, commerce and manufactures by mining, that, of all our great interests, it has had least recognition in every way from the national or State Governments. As the late J. Ross Browne said as far back as 1868: "If we take mining only in its past condition and its present transitive state, we must admit that it has caused most important general benefits, especially in anticipating by generations the peopling of the immense territories of the West, and thus widening the field for the display of national energies, broadening the spirit and firmly bracing the national credit. But for the mining furore of the last nineteen years, California would probably have remained a vast cattle range to this day, and all the great territories that adjoin it—now peopling with civilized communities and nearly traversed by a railroad uniting both shores of the continent—would still be savage wastes."

Probably the chief reason for the failure of the Government to give mining as much consideration as other industries is the fact that the miner—the "honest miner" of the West—is self-reliant by nature and seldom asks for help from others. This characteristic has given the tone to mining organizations. The California Miners' Association has, in fact, asked very little of the Federal and State Governments—less, indeed, than the magnitude of the industry they represent would warrant.

Take the State University, for example. Upon the College of Mines, in which there are enrolled more students than in any other scientific college in the institution, there is spent less money than on any of the others. The University is often spoken of as belonging to the people. Their desires should dictate, to a certain extent at least, what should be done there, and the fact that the College of Mines is more largely attended is evidence that mining education is wanted.

Although the college is doing good work, it is cramped for room, short of funds and has fewer instructors than it should have. This is true of other departments, but probably of none so much as this college. The fault lies largely in the fact that the mining industry is not represented in the Board of Regents, while other industries are.

If the California Miners' Association would ask the Governor to do so, it is hardly probable that he would refuse to appoint a representative of mining a member of the Board of Regents. That body is largely made up of lawyers and bankers, who manage the finances of the institution as well as those of any other public institution in the West. Aside from these men, the President of the State Agricultural Society represents one industry and the President of the Mechanics' Institute several others.

The whole mining world has of late years been looking to California for the best mining engineers. In the Rand and at Kimberley Californians have had charge of the largest enterprises; Californians have been called to Australia, to Siberia, to Spain, and all the way from Cariboo to Cape Horn California mining engineers are in charge of the greatest works. We have here in California the mines in which to train men for that profession. Geologists recognize the fact that there is no better field in the world for the study of that science than California. Everything tends to give the University of California an opportunity to build up the finest mining school in the world.

A regent in the university representing the mining industry could do much to enable the other gentlemen in the board to understand the value of the College of Mines and the needs of that department. The Governor need have no trouble in choosing a fit man for the position. There are in California mining engineers trained theoretically in the best mining schools in the world, and trained still better practically on the Comstock, and the more prominent mines of this State. Some of these men know mining, geology and mineralogy better than the average college professor, and know by experience what education can best fit young men for the profession. Where so good an opportunity exists to aid the great mining industry of this State it should be utilized.

Concentrates.

THE establishment of a mining exchange at Spokane, Wash., is being advocated.

A LARGE number of copper mining locations have been made lately in Del Norte county.

AT the Globe mine at Dedrick in Trinity County, Mr. Woodburn proposes to erect a 5-stamp mill.

IT is claimed that the mines of the Bingham district in Utah are able to put out 10,000 tons of ore per month.

THE Iron Mountain railroad in Shasta from Keswick to Iron Mountain has been opened for freight and passenger traffic.

ABOUT fifty carloads of freight are received at Colfax, Cal., each week for the mining towns of Grass Valley and Nevada City.

THE Gentle Annie quartz mine, near Placerville, El Dorado county, has been bonded by Melton and Parlow to T. D. Lane for two years.

NEGOTIATIONS are again reported pending in London for the sale of the Mercur mine of Utah, which is daily putting out 210 tons of ore.

ON Labor Day in Utah there is to be a great contest in ore drilling to be competed in by miners from Montana, Idaho, Nevada and Utah.

CHARLES M. GOODALL has bonded for one year the New York and New Year mines in Hunter's Valley, Mariposa county, from the owner, John Baretta.

IT is said that the Le Roi at Trail Creek, in British Columbia, is paying its owners $400 a day, the Slocan Star $1000 a day and the Silver King about $2000.

THE Potazuba Mining Co. has been organized at Sutter Creek by T. T. Lane, Senator Voorheis and others, to work the old Mechanics mine near that place.

FROM the enormous amount of printed matter sent out by both political parties it is evident that politicians, like all business men, recognize the value of advertising.

IN a rock-drilling contest at Helena lately, Joseph Freethy and John Davy of Butte came near the world's record of 41½ inches, drilling 40⅞ in hard blue granite in 15 minutes.

DURING the next two months there will be hauled to Dowds Landing, on the Utica Company's flume in Calaveras county, 600,000 feet of lumber for the construction of the flume westward.

ON a group of mines at Ragged Top in the Black Hills, Gen. Green B. Raum is operating a diamond drill claimed to be capable of sinking 2500 feet and bringing up a core 1¾ inches in diameter.

THE Crown Point, Hidden Treasure, White Swan and other claims at Rossland, B. C., have been sold for nearly $400,000 to a Toronto syndicate. This is the largest sale yet effected in the Trail Creek district.

THE Chicago and British company that is preparing to establish a 40-stamp mill and reduction plant on Cedros island, off the coast of Lower California, will probably use the cyanide process to extract the gold.

ON some picked ore from the S. Dewitt mine, in Cripple Creek, lately assays showed more than one-third to be gold. The certificates read 11,220 ounces, or $224,400 a ton, and is one of the highest returns ever given on fancy ore in that camp.

SEATTLE people are beginning to turn their attention to mining properties along the Straits of Georgia, between Vancouver Island and the mainland. While the ores are low grade, the cost of transportation would be light, and the bodies are large.

AT Green River, Wyoming, the Oil and Fuel Company is constructing a reservoir at a soda well which will be used to evaporate the product. It is expected to get 150,000 pounds of soda from one filling much of which will go to the cyanide works at Mercur, Utah.

IN digging a posthole for a hogpen near Angels Camp, Calaveras county, lately, Thomas Peachy discovered a 3-foot vein of pay ore. It is notable that many of the great mining discoveries, such as the Broken Hill of Australia and the Ontario of Utah, were made by accident.

ALTHOUGH a year ago Rossland, B. C., had but one developed mine, since then two mines in the camp have paid $275,000 in dividends. By October 1st there will be two railroads into the place, if the Columbia & Red Mountain is completed, as expected, by that time.

AN estimate of the amount of money produced at Tuscarora, Nevada, places the output of gold quartz at nine million dollars; placer diggings, six millions, making a total of fifteen million dollars. The Grand Prize, the richest mine, has produced about three million dollars.

GRAVEL MINING on large scales is being started up in Spain. A French syndicate has taken hold of the old mines in the Province of Leone, worked by the Romans at the beginning of the Christian era, and an English syndicate is exploiting some extensive deposits in the Province of Granada.

FIFTY-FIVE claims on the asphaltum beds on the Uncompahgre reservation have been filed for record in Utah. The claims embrace a strip from the Colorado State line near where it crosses White river, into the eastern border of Wasatch county, Utah, and wholly on the reservations.

AT the annual stockholders' meeting of the Marguerite Gold Mining and Milling Co., held in this city on the 25th ult. the following Board of Directors were elected: Wm. Schmitz, President; G. Gall, 1st Vice-President; F. M. Freund, 2nd Vice-President; H. Gimbel, Treasurer; Chas. Peach, Secretary.

JOHN FIELDING, in the Kootenay country in British Columbia, is an "honest miner." While surveying at the Ruth mine he discovered a fraction, which, if he had given a tip to some of his friends would have brought him probably $50,000. Instead of doing that he informed the owners of the Ruth, for whom he was doing the work, and they staked it.

COPPER mines are being developed on Texada Island, B. C. These mines are near the water's edge and the cost of shipping from the mine to smelters will not exceed $1 per ton—an important consideration. Recently two carloads of ore from the Apex mine in Money Creek, B. C., were shipped to smelters; the cost of packing to the railroad alone was $12 per ton.

THERE is a scheme to establish a plant at Salt Lake, Utah, for the manufacture of cyanide of potassium, now so largely used in the reduction of ores. The consumption of the article has increased largely all over the mining world and the increased demand has brought the price down. Another plant for the manufacture of cyanide is talked of at Niagara Falls.

THE Exploration Company of London has taken hold of a group of quartz mines in southern Oregon in what is termed Lucky Boy, in the Blue river mining district, near Eugene City. This is a new camp in which between forty and fifty locations have been made. George S. Baum, formerly at the Omaha mine at Nevada City, has been appointed superintendent.

IF the Argentaurum syndicate lately formed in New York should succeed in what it proposes to do before the election the silver question would be settled. The syndicate is building a laboratory to produce gold from silver and their savants can figure out as beautiful and convincing formulæ as ever came from the alchemists of the good old days before people became practical.

IT is reported that the Southern Pacific Company proposes to make Reno, Nevada, a terminal point—that is, charge no more on freight from the East to Reno than to Sacramento. This should do much good to the mines of that State, as well as to the agricultural interests. Heretofore it has been cheaper to bring freight to Sacramento and ship back to Reno than to ship direct to Reno.

GREAT forest fires have been raging in the Cœur d'Alene county, Stevens county, Washington, in the Metalline country and in the Kootenay, Slocan and other districts of British Columbia, and in many instances prospectors have been driven out by the smoke and heat. They are much worse than ever before because of the greater number of campers, prospectors and others ranging the mountains.

SOME of the gold coined by the United States has gone abroad and been melted down and recoined by foreign mints into their own money. Some is held abroad in a coined state. The Bank of Russia has $30,000,000 in American quarter eagles. Much gold coin which did not go abroad, but which lost some of its weight by wear and fell below the legal limit, has been recoined. The mint director estimates that there is about $600,000,000 of gold in the country.

AT Forty Mile creek in Alaska, the Canadian police levy a tax of $15 on each mining claim. In cases where there is a dispute as to whether the claim is on British territory the tax is not collected unless offered. If paid the owners are entitled to and receive police protection while those who do not pay are allowed to protect themselves. According to the *Mining Record* Forty Mile is very quiet, the diggings about worked out and the people are rapidly leaving the place.

THE second annual convention of the Northwest Mining Association will be held at Spokane, Oct. 6, 7 and 8, when it is expected that the districts of Montana, Idaho, Washington and British Columbia will be represented. Owing to its proximity to the great gold fields of British Columbia and the opening up of new mines in Washington, Spokane has become an important mining center, and the daily papers give more attention to that industry than anything else.

THERE has been a large increase in the number of mining students in the State University and at Stanford University this year, over eighty having entered the Colleges of Mines of these institutions at the last matriculative examinations. This not only indicates the increase in mining but an increased demand for men with proper training. Students have come to the two universities from many States outside of California, and this is an indication of the good reputations they are building up for thorough work. More than that, few of the graduates of the mining schools at Berkeley or Palo Alto are out of positions.

IT has been charged that the officers of the Palo Alto Company in British Columbia, which had received offers of 10 cents per share for a large quantity of treasury stock, from the sale of which working capital is obtained, have taken advantage of their position to swindle the company. It was the duty of the shareholders to obtain the best price possible for the treasury stock, in the interest of the company. Instead of doing this, it was moved and carried that the shareholders present take 50,000 shares at 5 cents a share—half the Toronto offer—thus enabling these shareholders to double their money by unloading at Toronto at the expense of the company.

AT Mercur it is denied that the Geyser is handling ores by the cyanide process at a gross expense of $1.77 per ton and that at both the Mercur and Marion the cost is less than $2 per ton. The Salt Lake *Tribune* says: "It is already known that by the roasting of the ores the percentage saved has been very materially increased. The only thing now is to reduce the cost of roasting that is already less than 50 cents a ton; indeed, much less in instances. Those who have worked most industriously upon the task know that nearly all the ores in the district contain an arsenical acid, and if it is made possible to roast all of them the result will be an important gain for the producer."

THE precious metals do not always supply the biggest mining stories for the papers. Tin will probably hold the record for a time now with the story telegraphed this week from Guanajuata, Mexico, of the discovery of deposits there with 100,000,000 tons of metal in sight, which at $400, which is about the usual market price, would be worth forty billions of dollars and at the present rate of consumption would last the whole world 1700 years. The telegram, however, is not so very definite and speaks of its assaying 6½ per cent pure tin. Even that is not bad. It would give 6,500,000 tons of pure tin worth $2,500,000,000 and would supply the world at the present rate of consumption 700 years. Truly, mescal is a marvelous drink.

ALONG the Rand in South Africa some fifty companies owning deep level mines—locations on the dip beyond the sidelines of outcrop locators—have sunk shafts the aggregate of whose depths so far is about 25,000 feet. Of these not more than one-fourth have reached the reef and the estimated additional aggregate depth to be sunk is 36,000 feet, and when this work shall have been accomplished the united depths of all the shafts will be about 62,000 feet or between eleven and twelve miles. There is great rivalry at times among the managers to make records for fast sinking. At the Robinson, at a depth of 1700 feet, 100 feet were sunk in a month by hand work. The best rock-drilling men are given high wages, some receiving from £60 to £70 per month.

THE fall in the price of lead is closing down a number of mines. The Ontario in Utah is closing: at Wardner, Idaho, it is reported that the leasers of the Stemwinder will store their ore for better prices. The Bunker Hill and Sullivan has laid off about 50 men owing to the low price of lead, but it is not thought that any more will be laid off unless the price of the metal further declines. The manager of the Red Cloud in Idaho, which has also stopped work, says that with lead at $2.50 per 100 pounds and silver at about 65 cents per ounce he can not pay expenses and will not try to do so. At the Last Chance mine at Wardner, owing to the fall in price of lead there was a cut of fifty cents per day in wages all around last week and 18 men quit, but their places have been filled. One of the largest smelters in Utah is closed and another announces that it will stop work as soon as the material on hand is worked up.

IN the Rand, South Africa, mining engineers are able to calculate the depth of reefs very closely up to 3060 feet from the outcrop, as is shown in the case of one of the shafts in the "Robinson Deep," which, a year ago, John Hays Hammond calculated would reach the reef at 1800 feet. The reef has lately been struck at a depth of 1806 feet. The average depth to which the main reef series has been stoped is not over 400 feet, and this shaft demonstrates the permanency of the reef to 2000 feet in vertical depth or nearly 4000 feet on the incline. It is estimated that £35,000,000 in gold has been taken from this series so far, and that the deep shaft sinking has demonstrated that there is available at least another £140,000,000. If the reefs continue to pay, it becomes a question to what depth with present known methods mining may be continued. It is claimed that 5000 feet vertical depth will not exceed the limit. This would give about 8500 feet on the incline.

THE associated mine owners of Leadville, failing to bring the striking miners to terms, last Monday decided to draw their fires and allow the mines to be flooded with water. In a few days they will be in such shape that it will take a year to clear them out again. The 10,000 miners and their families who have relied upon the mines of Leadville for their support must now seek employment in other fields. This great strike, which has lasted sixty days and ended disastrously for both sides, was caused by a demand on the part of the miners that affected a small part of those employed. The mine owners were willing to pay the rate that has always prevailed in Leadville, which was practically all that the union demanded, with the exception that the surface men were to receive $2.50 per day. It is possible that had the price of lead not become so low the mine owners might have been able to offer some concession to the miners, and it is probable that the late sudden fall in lead prices has had much to do with inducing the mine owners to take the steps they have.

GARDINER F. WILLIAMS, manager of the DeBeers diamond mines in Kimberley, South Africa, who is here on a visit to his relatives, says that the company of which he is manager owns five mines at Kimberley. One is down 1000 feet, another 1200 feet, and the third is being worked in the open; two are not being worked at all. The company employs 1400 white men and 6000 natives at the mines. "Last year we paid $8,000,000 in dividends," says Mr. Williams, "and this year we will pay the same amount. Cecil Rhodes, whom I have always found to be an excellent gentleman, is chairman of our company, and Barney Barnato is the life governor of the corporation. Arrangements have been made so that now we control the diamond market of the world. Some time ago a big syndicate was formed in England for the purpose of buying our diamonds. Members of this syndicate have their agents at Kimberley, and every week we make a cleanup and division of about 50,000 or 60,000 carats. In this way we find that we can keep the market of the world steady."

IN the next issue (Sept. 12) appears the closing installment of "California Mines and Miners," publication of which began in the issue of April 25. It has occasioned great interest all over the coast, and few things that the MINING AND SCIENTIFIC PRESS has published have elicited heartier praise. In the forthcoming biennial report of the State Mining Bureau a list of the mines and mining superintendents of California will appear of greater length and higher accuracy than the list which has been appearing in these columns for the past four months. The State can do those things better than private individuals, and State Mineralogist Crawford has been, as usual, accurate and painstaking in procuring correct data for such lists. This is said to dissipate a singular notion prevalent in some of the counties that the State Mining Bureau was in some way responsible for the errors and omissions that were unavoidably manifest in the list as published herein. Such was not the case. It was distinctly stated at the outset that the attempt was a pioneer one; that no accuracy or completeness was claimed, and that the idea was solely an approximate attempt to supply what was evidently required.

THERE is no industry that will build up a country as quickly as mining. In the Kootenay country, in British Columbia, the following machinery has been erected, nearly all within the past year: Slocan Star, 150-ton concentrator, 5-drill compressor and sawmill; Idaho and Alamo, 100-ton concentrator; Washington, 50-ton concentrator. In the Ainsworth district: The Number One, 50-ton concentrator; Canadian Pacific Mining and Milling Company, a 5-drill compressor and 50-ton concentrator; Kootenay Mining and Smelting Company, 100-ton smelter, 150-ton concentrator and 5-drill compressor. In the Nelson district: The Hall Mines Company, a 50-ton smelter and 50 tons additional ordered, 5 drill compressor; the Poorman, 10-stamp mill and 4-drill compressor. At Waneta the Kootenay Water Supply Company has three rotary pumps with a capacity of 5,000,000 gallons, and is about to install an electric plant to furnish power to the camps. At Trail A. Heinze has in operation a 200-ton smelter, to which additions are to be made. In the Rossland district: The O. K., a 10 and a 5-stamp mill and a 5-drill compressor plant; the Le Roi, a 40-drill compressor, a 10-drill compressor, 20, 50 and 250-horse power hoisting engines, 600-horse power battery of boilers, electric light plant, fire pumps, etc.; the War Eagle, a 20-drill compressor, 200-horse power boiler and two 50-horse power hoisting plants. Aside from all this, railroads have been projected, towns built and lighted with electricity and all the accompaniments of civilization brought in, and all within the short space of a year. Nothing but mining could accomplish these wonders.

Ocean Transit of Timber.

On the 27th ult. there arrived from the Columbia river, nearly 600 miles north of this port, a raft of logs—the second successful shipment of the kind. The first raft arrived here Aug. 1st, '95. The second was built at the same place by the same men, Bains & Robertson, Stella, Wash. The same tug, the Minneola, towed both rafts; the '95 raft was towed from bar to bar in 5¼ days; the '96 one in practically the same time. The '95 raft was 580 feet long, 52 feet wide; its girth amidships 139 feet; at the tapered sections 45 feet, being shaped like an immense cigar; it contained 5500 M feet, board measure, weighed 10,000 tons and cost here $37,000. The one that arrived last week was 528 feet long, 52 feet wide, 31 feet deep, contained 6000 M feet, board measure, and was built in just the same manner as its predecessor.

Bains & Robertson have had a varied experience. They built the same kind of rafts on the Atlantic side, and, after some disastrous losses, made a success of the project. The first one they built on this coast, in March, '94, was lost in a storm. The second and third have reached port successfully. They say now that they propose building a mill on the Alameda county shore, San Francisco bay, and manufacturing lumber here at a reduced cost of $3 per M feet; that, by bringing the logs down in rafts, they can furnish the lumber that much cheaper than when it is sawed on Puget Sound, British Columbia or the Columbia river and brought here by sail or steam.

Two views of the big raft are here given—one where the big cradle is being filled with logs and the raft about one-half built, at Stella, Wash., the other as it appeared in tow of tug, with river steamer to assist in rounding turns in the river, just previous to its emerging on the ocean en route to this port.

THE CRADLE BEING FILLED WITH LOGS.

Activity in Mining Enterprises.

Mining enterprises of the present day represent an enormous amount of invested capital. Probably, few, if any, other enterprises have the same claim on the public purse. Interest grows with every discovery of the precious metals. Signs of ore, no matter where found, in mountain or valley, in the sands of Africa or the snows of Alaska, no matter what the climate, risk or remoteness, are the signals for a stampede of men and money. Idle capital has a keen scent, and it can, as a rule, be depended upon to strike a bee line prompt and direct to the richly filled vaults of Mother Earth. It is easily captured by the shrewd and unprincipled promoter, who, angling in a shoal of golden fish, generally succeeds in landing the coveted price. History furnishes no end of examples of this kind. The greed for gain is now, and always was, more strongly marked in those who, in a financial sense, need it the least. Nor is it out of the usual experience of human nature that men with more audacity than principle, and with more shrewdness than conscience, are always in evidence when the opportunity of raking in the ducats is afforded them. In mining enterprises there was a time, and the clock has not run down yet, when the goose to be plucked and the man to bag its feathers were in abundance. It is, however, to be noted that a change for the better is showing itself. The ethics of mining are improving, and though rogues may be as many and fools as numerous, experience has not been without its remedial results. Mining is being lifted out of the gambling pit, speculation is less hasty and more strictly honest and reputable men are engaged in mining transactions than ever before. This, says the *Age of Steel*, is a healthful sign, and is doing more to place mining enterprises on a legitimate and permanent basis than any other means that could be devised. Of course there is always more or less of uncertainty in mining returns. This is inseparable from the situation. Till the subterranean vault is opened, there must be more or less guess work and speculation as to its contents. Science, however, is not so likely, as when less intelligent or experienced, to make any grave mistakes. It follows the trail of minerals, as a bushman does the spoor of a giraffe, or a hound the circle made by a stag or a hare. Its decisions are seldom guesses and the lay speculator has his risks minimized. The facilities for securing trustworthy information as to the standing and character of firms and corporations interested in mining developments, are largely increased, and men with a reasonable amount of caution and prudence can in nine cases out of ten "look before they leap." These facts considered, mining enterprises are less hazardous and the investor more secure. The elimination of abuses has been slow but continuous. Fraud is having a tightened bridle. Speculation is less a private vice or a public craze. Mining enterprises are less vagrant and spasmodic, and the class of men engaged in the business are of a better class than at one time dominant. With abundant resources of raw material, cleaner methods of business, and the more systematic building up of a great industry, the mining interests of the country have a broadening and a brighter prospect of stability, and a higher place in public confidence.

THE RAFT IN TOW OF TUG WITH RIVER STEAMER TO ASSIST IN ROUNDING TURNS IN RIVER.

Handsome and Effective Advertising.

(Continued from page 189.)

handsome book of 128 pages is filled with statistics of Colorado's mineral productions, description of different mining sections of the State and the process of extracting and reducing the ore, illustrations of different prominent mines and mining scenes with much local and general information, the whole being a splendid advertisement of the State. It is a pity, for a variety of reasons, that those who control the destinies of California railroads, and who are supposed to be interested in the progress of this State, cannot see the value of such publications.

Just as a "sample brick" the following from the heart of the publication cited is here given place. It is entitled

PLACER MINING ON A LARGE SCALE.

For ages the water from melting snows has percolated through the mother veins of gold in Gilpin and Clear Creek counties, and drop by drop loosened the little particles of metal from their snowy matrix, later gathering them together, as the waters reached the proportions of torrents, and deposited the gold in the bed of Clear creek. Flowing towards Golden, the water kept the quicksands in the bed of the river in constant motion, with the result of settling the heavier particles of gold on the bottom. Gradually the little yellow grains moved eastward, until a sudden projection of rock—a riffle, as the miners call it—stopped further progress. These riffles in time gathered quite a large pocket of metal, and for years the bed of the creek has been worked over and over by placer miners, who searched diligently for the little hordes of wealth stored by Nature beneath the flowing water. From Golden to Forks Creek, and sometimes up to the outskirts of Georgetown, the treasure hunters plied their occupation year after year. Flumes and riffle boxes sometimes a quarter of a mile long were erected, but seldom did there appear enough capital invested to make a very great showing. The men, generally, were satisfied to get fair wages, with the prospect of stumbling onto a riffle in the rock and cleaning up enough to keep them for a year or two.

AMERICAN PLACER, NEWLIN'S GULCH.

Last year there was a change. The uniform success of the workers, with primitive appliances, attracted the eyes of capital. A careful inspection of the river bottom was made, and at a point twenty-six miles from Denver it was discovered that the bottom of the creek was cut across by a wall of granite. A company was organized and operations began. A mile above an old stone dam was so changed that the water of the creek was diverted to one side of the bed. From this point a large flume was constructed to carry all the water for a mile and empty it again into the bed of the creek, below where the natural dyke was found. The object was to drain the whole creek, so that operations might be carried down to bedrock. An immense steel pipe was laid from a point far up the creek, to carry water for hydraulic mining, and a peculiar nozzle was sunk into the sand just above the dyke. When the water was turned on it came with terrific force and picked up great quantities of sand from the bedrock and conveyed the whole mass over a long flume, with riffles in the bottom, where the little particles of gold were caught and afterward recovered. For a time the elements rebelled against this robbery of Nature's treasures, and about as soon as the flume was in thorough working shape the great rain clouds towering above the dark cliffs suddenly parted, and a rush of water swept part of the works away. Again they were rebuilt, stronger than before, and once more did Nature protest. Then the persistency of man asserted itself, and a flume was built stronger than it was probable the waters would ever be, and for the remainder of the season the recovery of gold was successfully carried on.

The success of the first plant was responsible for another. Ex-Governor Prince of New Mexico and associates located on the creek thirty-five miles from Denver. Profiting by the experiences of the former company, they erected a flume a mile long, and along the side of the canyon walls. Their flume was not to drain the creek, however, but to carry water to a considerable elevation above their works, so that great pressure could be secured. They constructed a temporary dam around a small portion of the creek's bottom, and then started toward bedrock within the walls of this protection. The plant was completed too late in the season for any great work before the blasts of Boreas froze up the creek, but with the gentler zephyrs of spring, warmed by the smiles of Old Sol, will come activity around the plant, and the saving of gold will be begun in earnest. Undoubtedly other plants of a similar nature will be placed in during the coming summer, and as the bed of the creek is miles in extent, and each succeeding freshet only adds to the store of gold, there is plenty of room and lots of metal for all comers.

NEWHOUSE TUNNEL, IDAHO SPRINGS.

There is nothing technical or exact about the above. Were it published in the MINING AND SCIENTIFIC PRESS as an addition to the stock of knowledge on the subject, the only comment from miners would be an expression of surprise that this paper should devote so much space to a matter so thoroughly understood, when what was said conveyed no exact information; but it is meant for a class who have money to travel, and who are less interested in technical details than in the outlined indications of things to see and profitable investment therein.

INTERIOR OF MINERAL PALACE, PUEBLO, COL.

The Free Coinage of Gold.

The coinage of gold in the United States is free and unlimited; that is, any and every owner of gold bullion has the right to take it to the mint without limit as to quantity and receive in return therefor, and free of charge for mintage, full legal tender gold coin of the United States, weight for weight with the bullion deposited. The weight of standard gold in the dollar is 25.8 grains, and therefore the ounce of standard gold of 480 grains will coin into gold of the value of $18.604. So it is that the coining value or mint price of the ounce of standard gold of the United States Mint is 18.60\frac{4}{10}$. By standard gold is meant gold of the correct fineness for coinage which is in the United States nine parts pure gold and one part alloy. The British standard gold coin is 22 carats or $\frac{11}{12}$ fine. Hence, standard gold in America is 900 fine, while British standard gold is 916$\frac{2}{3}$ fine.

At the British mints the coinage value of an ounce of gold, 22 carats or $\frac{11}{12}$ fine, is £3 17s. 10½d. In both countries the mints are open to the free and unlimited coinage of gold, the mint authorities being obliged to accept gold on deposit for coinage, without limit as to quantity, and return to the depositor, without charge for mintage, the same weight of gold deposited, in the shape of legal tender gold coin. Thus, in America the owner of gold bullion can and does take it to the mint, and if he deposits gold bullion of standard fineness, that is, $\frac{9}{10}$ fine, and suitable for coinage without further refining, he will have returned to him, absolutely free of any charge for mintage, gold coin at the rate of 18.60\frac{4}{10}$ for every ounce deposited.

The practice in Great Britain is somewhat different. Although under the British mint laws any individual has the right to deposit gold at the mint for coinage, such privilege is not exercised. The reason for this is that the Bank of England is obliged to purchase all gold offered at the rate of £3 17s. 9d. per standard ounce, or at a discount of 1½d. per ounce from the coinage rate. That owners of gold bullion prefer to sell their gold to the Bank of England at this discount rather than deposit it at the mints for coinage is due to the fact that by so selling their bullion they can at once realize upon it, while, if deposited at the mint, they would have to await the delays of coinage for payment, thereby suffering loss of interest on the value of the bullion. This obligation of buying all gold offered does not rest onerously upon, but is rather a source of profit to, the bank, which, it is currently believed, is permitted to issue its notes against such bullion bought, just as it issues its notes against gold coin, so that the bank has full use of the gold during the process of coinage.

It has been a common practice among Governments to charge a seigniorage on coinage sufficient to offset the expenses of coinage, but since 1875 there has been no such charge in the United States. By seigniorage is meant the difference between the bullion and face value of coins. Under our mint system no charge for the coinage of either gold or silver was made prior to 1853, but the Mint act of that year, February 21st, provided that after July 1st, 1853, there should be a charge to the depositor of one-half of one per cent on the value of bullion, whether of gold or silver deposited. This charge amounted to $9\frac{3}{10}$c. on every ounce of standard gold deposited, so that the depositor of gold, instead of receiving as for some years prior thereto $18.604 for every ounce of gold deposited, received but 18.51\frac{1}{10}$. This charge was expected to defray the cost of mintage, and it remained unchanged until April 1st, 1873, when it was reduced to one-fifth of one per cent. Two years later, by act of January 14th, 1875, all charge was abrogated, and the coinage has remained free ever since.

But free coinage of gold does not mean that for every 23.22 grains of pure gold (the weight of gold in the dollar) deposited at the mint that the depositor shall receive free of all charge a standard gold dollar weighing 25.8; or, in other words, that for 100 ounces of pure gold deposited he shall have returned to him 111.11 ounces of standard gold coin. The cost of mintage is borne by the Government, but the cost of refining and alloy must be paid by the depositor. If the depositor deposits bullion of standard fineness, well and good. He will then have returned to him the equivalent of a gold dollar weighing 25.8 grains for every 25.8 grains of standard gold deposited and without any charge. But if the bullion deposited is crude, so that it must be refined and alloy added to make it of proper fineness, the depositor must pay the cost of refining and the alloy. So if 100 ounces of pure gold was deposited, the depositor would have to pay for the $11\frac{1}{100}$ ounces of copper used as alloy before receiving in return 111.11 ounces of standard gold coin. The cost of mintage is borne by the Government, but the cost of alloy, refining and preparing the bullion for coinage must be paid by the depositor.

Vein Walls.*

NUMBER III.

By T. A. RICKARD, State Geologist of Colorado.

(*Condensed.*)

In the Mammoth mine, Pinal county, Ariz., the granite in the east crosscut at the 300-foot level, north, has an extraordinary number of fissures partially occupied by broken pieces of rock, so wedged in as to leave open spaces. The pieces are not of any foreign rock, but are identical with the enclosing granite.

This instance suggests why mining excavations collapse, and yet a natural cavity underground might remain open. The former contains unconfined air only, while the latter may be filled with a confined and practically incompressible fluid, water.

It is the usual experience in mining that when the abandoned workings of a mine are flooded they are less likely to collapse than when they are dry. This is partly due to the exclusion of air, and partly to the sustaining power of water itself, as suggested by Mr. P. Argall.

The formation of the hollow spaces occasionally seen in veins is, I believe, in most cases subsequent to the ore deposition, and may therefore have taken place at a time when erosion had brought that portion of the vein near to the surface. The Indiana section shows that the cavities have been produced by the shattering of a vein of zinc-blende already formed. The only occurrence of later date is the consolidation of the mass by the agency of water bearing silica, unaccompanied, so far as can be seen, by the deposition of any metallic minerals. In the Mammoth mine the blocks of rock wedged within the cavities were coated with crystals of vanadanite and wulfenite; but there seems to be no connection between the presence of these later minerals and the formation of the ore-bearing parts of the lode. They are the result of secondary processes, of which the upper part of a lode is the characteristic zone of activity.

Incidentally, I would say that I know of no mining district which illustrates modern views on ore deposition so clearly as does Cripple Creek. Of such mines I would quote the Independence vein, whose richness is such as to cause its commercial value to obscure its scientific interest. It does illustrate very aptly, however, this part of our inquiry, because the ore is so very evidently only altered country rock. In 1893, when the workings had not penetrated far from the surface, the carloads of ore sent from this mine to the Denver smelters gave the impression that some one had blundered, and either shipped waste from a crosscut or else switched cars of ballast into the place of loads of ore. One could see that it was the normal Pike's Peak granite with its big pink feldspar, but it required a trained eye to note that the mica had been largely removed, leaving small iron-stained patches. It was ore by courtesy, because there was enough gold present to give it a certain commercial value; but to the petrographer it was clearly granite, not much altered and but slightly mineralized.

The vein leaves the granite and, going northward, penetrates into andesite breccia. Its character remains the same; the ore is still altered country rock, only now it exactly reproduces the structure of its new encasement, and the habit of the andesite breccia is quite evident, although blotches of sylvanite and fluorite may occasionally try to obscure it. The strike of the vein, its width, its richness, all appear unaffected by the passage from one formation into the other, while the change in the structure of the ore is so marked as to render it easy for the observer to know what is in the enclosing rock without looking at the walls.

In a case such as this—and it is not abnormal—it is not necessary to suppose the original existence of an open cavernous fissure since the material of the vein is the material of the rock which was there before vein formation began. The vein follows a line which became a path for metal-bearing waters. Minute interspaces there probably existed, such as would be produced by the crushing and slight dislocation of particles of rock lying along a line of fracture; but a clear opening, a crevassing, such as accompanied the origination of the dyke, seems hardly needed.

Occasionally, it is true, we do find veins full of minerals foreign to the encasing rock, and so symmetrically arranged in bands having a comb structure as to suggest to many investigators that they were formed by successive crystalline growth from the walls of a vacant fissure. The reversed repetition of the quartz, rhodochrosite and sulphides is evident enough; but the most striking feature to me is the equal width of the two bands of the same mineral. Each vein of mineral would seem to have been fractured exactly in the middle previous to the deposition of the next succeeding one.

The Accumulation of Amalgam on Copper Plates.*

NUMBER III.

Communications in discussion of the paper of MR. R. T. BAYLISS, presented at the Pittsburg meeting, February, 1896.

Robert Gilman Brown and R. C. Turner, Bodie, Cal.: The facts of particular interest in Mr. Bayliss' paper are the value of the absorbed amalgam and the changed ratio of silver to gold in the adhering amalgam, as compared with that of the routine clean-ups.

A single statement on the first point deserves special consideration, namely, that "upon being cut up and melted into a bar, the value of the gold and copper contents amounts to more than twice the value of a new plate; hence the subsitution of new plates for old is an expenditure which can be viewed without concern."

This conclusion is not of necessity ture; and whether it be true or not depends upon a question to which the conditions of the case give no answer.

Does the absorption of amalgam into a new plate proceed promply, being chiefly accomplished within, say the first thirty days of use, or is it a direct function of the time, increasing in simple proportion?

On the face of the matter the former seems the most probable, as the appetite of the plate for the amalgam should become weakened with its partial satisfaction. On the other hand, it is possible that the soaking of the amalgam into the plate may proceed so slowly as to make the monthly rate appear practically constant for several months, or even years.

To obtain a little light on this point, three strips of silvered copper, approximately 1x3 inches in size, were placed on the battery apron of the Standard Company's gold mill at Bodie, California, which is operated without battery amalgamation. There they were left for varying periods and subjected to the same routine of cleaning and scraping with the aprons themselves. They were finally cleaned as closely as possible, all surface amalgam being removed, and their values were determined. The complete results appear in the following table:

These leave much to be wished for in the way of more complete information, but also serve to strengthen the *a priori* probability of the alternative first stated above.

Studying the absorption of gold only, the rate per day per square inch of surface for the several strips is as follows:

No. 1—3.68 milligrammes.
No. 2—1.14 milligrammes.
No. 3—0.68 milligrammes.

Or for No. 2, assuming its unit increase for the first two days to be the same as that of No. 1, the increase for the remaining five days is 0.60 milligrammes, or 0.12 milligrammes per square inch per day. And for No. 3, assuming its increase for the first seven days to be the same as for No. 2, for the remaining seven days it is 1.51 milligrammes, or 0.22 milligrammes per square inch per day. This result, though not quite at one with that from No. 2, still marks strongly the tendency in the case.

From this it would appear that the destruction of plates for the sake of the absorbed amalgam may be poor economy. For if, as appears probable from this experiment, the greatest absorption takes place in the first few days of the run, the larger part of the value recovered by destruction of the plate is immediately taken up again from the daily amalgam, and at the same time the mill is taxed for a new plate.

But, in any event, it would appear that the recovery of absorbed values by destruction of the plate is of the nature of a discounted loan, in which the discount amounts to the value of the new plate, and the repayment of which must be provided for by monthly deductions from product, to the amount of which the loss of interest on these deductions must be added. With more complete data as to the rate of absorption this could be expressed as a formula; but the constants would certainly vary with different ores and changed conditions of plates.

(*To be Continued.*)

—OFFICE OF—

VICTOR AMALGAMATOR CO.,

703 South Main Street.

Los Angeles, Cal., August 18th, *1896.*

Curtis-Harrison Advertising Co.,
Southern Cal. Agents Mining and Scientific Press,
349 Wilcox Building, Los Angeles, Cal.

Gentlemen:-

Your suggestion that we use the Mining and Scientific Press for advertising our Victor Amalgamator has proven a good one.

We have received more inquiries and much better results from our small advertisement we placed some time ago in that journal through your agency than we have from all other advertising we have ever done.

Besides Eastern, Northern, and local points, we have heard favorably from Old Mexico, New Mexico, Arizona, Colorado, Nevada, and British Columbia.

We have found this space very valuable and are well pleased with the service of the Mining and Scientific Press.

Yours very truly,
Victor Amalgamator Co.

By J. A. Hedge M'g'r.

CALIFORNIA MINES AND MINERS.*

Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

*Begun in issue of April 25, '96. (To Be Continued.)

Do You Know

THAT THE . . . .

MINING AND SCIENTIFIC PRESS

HAS THE . . . .

★ Largest Circulation of any Paper of the kind in the United States? : : : : :

THAT IT IS . . . .

THE ONLY PAPER

. . . . OF ITS CLASS

✦✦✦✦ THAT GIVES THE EXACT FIGURES OF ITS CIRCULATION? : : : : :

It is Weekly Read by More than 20,000 Men in Every Department of Mining and Mechanical Industry.

IF you want your business announcement seen only by *YOURSELF AND YOUR COMPETITORS IN BUSINESS* put it in some one of the numerous catch-penny advertising schemes daily proffered you, without circulation, standing or influence.

IF you want your business advertisement seen by the *MEN TO WHOM YOU NATURALLY LOOK FOR BUSINESS*, put it in the

MINING AND SCIENTIFIC PRESS.

A paper that has led in its line for thirty-six years must have the qualifications that entitle it to the patronage of intelligent men who realize that, while advertising pays, money is thrown away that is given for advertising in papers with no circulation and which give no results

It is not what advertising costs, but what it produces that determines its value.

The MINING AND SCIENTIFIC PRESS produces satisfactory results to those who use it. : : : : : :

Economy is the judicious expenditure of money. It is sometimes economy to save ten cents; it is sometimes economy to spend a thousand dollars. Economy in advertising means to put your advertisement where it will do you good.

Success or failure depends upon profitable advertising. Our patrons find an investment in our columns a profitable one.

J. F. HALLORAN, Gen'l Manager,

12 FRONT ST., SAN FRANCISCO, CAL.

Electrical Progress.

Kern River Electric Plant.

The power of the Kern river, the third largest stream in California, is now about to be utilized, the work undertaken by the Power Development Company being nearly completed. The contract for the electrical equipment has been awarded to the General Electric Company, whose three-phase apparatus will be used to transmit the power of the river to Bakersfield, fourteen miles.

The point selected for the power house is at the mouth of the canyon on the north side of the Kern river, almost sixteen miles northeast of Bakersfield by wagon road. Here the stream, after a boisterous course of one hundred miles from the slopes of Mt. Whitney, through a series of rugred, precipitous canyons, forms a number of cataracts and rapids previous to taking a placid course through the cultivated valley lands. The point of diversion of the necessary flow for the power is some 9000 feet up the canyon. Some idea of the difficulties to be overcome in this work may be gained from the fact that to secure a bed for the flume a roadway was cut from the solid rock along the sides of the canyon. All the timber was hauled by team a distance of sixteen miles to the south side of the river. A bridge was thrown across the tramway 325 feet long, with a grade of 30 per cent, laid up the steep hill to the point where the flume was to end. A steam sawmill was then set up at the foot of this tramway, the timber cut to proper dimensions, loaded on the cars and hauled up the grade.

The flume was begun at the power house end. This flume is 8 feet wide and 6 feet deep and is covered. A railroad track is laid upon the cover for the full length of the flume, 8000 feet. There are no sharp angles, the changes in the course being made by curves and tangents. The grade is 5.8 feet to the mile, and 475,000 feet of redwood is used in the construction of the flume, which at one point is carried on an arch, with a 60-foot span, over a bad place on the cliff. The flow is calculated at 280 cubic feet per second. At its terminus at the mouth of the canyon, 8574.9 feet from the point where it leaves the river, it is 202 feet above the power house. Here the water enters a steel pipe 540 feet long and 5 feet 6 inches in diameter. The fall from the end of the flume to the power house is 201.9 feet, and the capacity of the water is estimated at 7500 H. P.

The electrical equipment will consist at first of two 450-kilowatt General Electric three-phase generators, running at 257 revolutions per minute. The voltage at the dynamo terminals will be 550. This will be raised in step-up transformers to 11,000 volts, and will be carried on six No. 4 bare copper wires to the sub-station at Bakersfield, where it will be transformed down to 2000 volts for distribution.

The current will be utilized at first to operate an extensive system of electric railroads connecting Bakersfield with Kern and other districts. It will also be applied at once to street and house lighting, as well as to the operation of pumps for irrigation purposes. The mines in the mountains to the east will also probably take current for their mills, hoists, pumps, etc.

The president of the company is Chas. Webb Howard. W. F. Goad is vice-president and C. N. Beal secretary and treasurer. The work is being pushed to completion as rapidly as possible, and it is expected that by November 1st the current will be turned into the transmission wires.

Danger From Electric Current.

Nikola Tesla says every metallic paint is a conductor of electricity, and it is only one of the many dangers to which persons unaccustomed to dealing with that fluid are subject. "You cannot call it a new danger, as it has existed, of course, ever since electricity was first put to practical use. It is, however, a new instance of the fatal result of carelessness in dealing with it." The great minds in the sphere of electricity are constantly seeking to minimize the danger of high voltage in cities. They are striving to render it as harmless as it was in the hands of the Greeks, for therein lies a discovery that will be as great a boon to mankind as its benefits.

Any one is infinitely more safe in an iron building amidst scores of wires than in a brick or wooden building, because the very proximity of so many wires would tend to draw the electric current one from another, and the iron would draw it from all, thus minimizing the danger to any person in a building where electric wires are in use. Death might, of course, be found in a gilt picture frame, providing the current was strong enough and the conditions permitted a ground connection. It would be perfectly safe to touch any object that might be charged with electricity provided the feet did not touch the floor, or that the latter was of dry wood, carpeted or covered with some other non-conductor. But if the floor should be of iron or other metallic substance, or of wet wood, the necessary ground connection would be there, and the current would pass through the body.

A Growing Business.

The growth in the use of electricity is none the less rapid because carried on quietly. To gauge the progress, attention should not so much be directed to the fields of electric lighting and electric railways as to that of electric power, a field which is now steadily repaying the arduous culture bestowed upon it during the past few years. Not a day now passes without the record of some extensive project for the transmission of power, or of the completion of some installation in which the current is used either to supersede steam, or in new places where steam would otherwise have been selected. Mills, mines, factories, shops of all kinds all over the country are steadily coming to the use of electric power, and the first failure has yet to be recorded. The economy and efficiency of electric power is perhaps most forcibly demonstrated by the extent of the orders placed for power apparatus, for it may be confidently asserted that greater engineering talent and closer examination is brought to bear upon electric power apparatus than upon apparatus of any other order. We have secured from the General Electric Company's power and mining department some figures which illustrate not only the growth in the use of electric power, but also its economy and efficiency. These figures are represented in the unfluctuating H. P. instead of in dollars, which, on account of the fluctuation in prices, offers no standard gauge—the figures taking cognizance of electric power apparatus only:

	1892.	*1893.*	*1894.*	*1895.*
Horse Power.....	13,719	18,762	42,379	46,727

In 1896 the missionary work of the past four years began to come to rapid fruition. From January 1st to July 1st the total H. P. of the apparatus ammounted to over 48,000. During the same period in 1895 the aggregate orders amounted to 25,737 H. P. From August 1st to August 18th the total amount of power apparatus ordered during 1896 was increased to the respectable figure of 62,164 H. P. Such a showing in face of the universal dullness in business everywhere is remarkable.

THE United States Consul at Copenhagen, Robert Kirk, has forwarded to the Department of State at Washington a description of a new electric telegraph. The apparatus was constructed by a young boatswain in the Danish navy, and makes it possible to communicate with a ship at a certain anchor ground without any direct line from land. An electric battery is placed on the shore with one pole in contact with water or moist earth, while the current from the other pole, through a telegraph key and a revolution interrupter, is conducted to a cable, which is laid out to the anchor ground and placed around the latter in a coil with a diameter of 1000–1200 feet. On board the ship, which is situated at the anchor ground or a short distance outside the coil, there is a small solenoid with which a telephone is connected. When a message is sent from the land a bell sounds on the ship, and the communication is sent by the telegraph key through the telephone instrument. The signals may be based on the Morse alphabet. The apparatus may also be so constructed that an answer can be sent from the ship. The inventor thinks he will succeed in making it possible to speak through the instrument, as in the case of the common telephone. Vessels at sea, it is said, will be able to telegraph to each other when each has a solenoid on board. The distance at which they will be able to do so will depend on the length of wire and strength of the electric batteries.

Scientific Progress.

Conductivity of Metals at Low Temperatures.

Prof. J. A. Fleming, F. R. S., has given an account of some researches made in conjunction with Prof. Dewar in the laboratories of the Royal Institution into the magnetic and electric properties of metals at low temperatures. These showed that the conductivity of a pure iron wire, at ordinary temperatures only about one-sixth of that possessed by a copper wire of equal size, was increased nine or ten times under the influence of the cold of liquid air. But while pure metals had their conductivity immensely increased by intense cold, it was shown that alloys, such as brass or German silver, experienced in the same circumstances a comparatively small increase in conducting power—not more than about 10 per cent. By carefully examining with a suitable form of resistance coil the variations in the electrical resistance of a large number of chemically pure metals cooled to about 190°, Profs. Dewar and Fleming have established that every pure metal would in all probability have no electrical resistance at the zero of absolute temperature; or, in other words, would become a perfect conductor of electricity. In this condition the passage of an electric current would generate no heat in it. Another consequence would be that a pure metal at the absolute zero would form an absolutely opaque screen to electro-magnetic radiation. These experiments furnished an additional proof that the process by which an electric current was conveyed from place to place was primarily dependent on actions going on outside. At the absolute zero any electric power, however large, could be transmitted along metallic wires; however small, without loss of energy. Of mercury, at its freezing point, the conductivity rose fourfold, and beyond that point increased in such a way as to show that at the absolute zero its conductivity would be perfect. The peculiar differences in the resistance of pure and slightly impure bismuth were described and proof was adduced that the result of taking the electric resistance of a wire of any metal in liquid air afforded a conclusive test of its chemical purity. It was found that the remarkable property possessed by bismuth of undergoing a great increase in electrical resistance when placed in a magnetic field was increased several hundred per cent by the cold of liquid air. In contrast with metals, carbon and non-metallic bodies increased in electric resistance as their temperature was reduced, this increase continuing to take place as far as the lowest temperature reached. In conclusion, Prof. Fleming laid stress on the value of the knowledge gained about the electrical resistance of metals at low temperatures as a means of testing the purity of a metal almost rivalling the spectroscope in delicacy, and said that the facts collected would prove of importance in judging the validity of existing hypotheses of electric and magnetic action, while at the same time they opened out a wide field for fascinating research in a region hitherto but little explored.

A Synthesis of Humanity.

In the museum of one of our great medical schools there is a large case filled with bottles—a ghastly collection—for they contain the physical ingredients of a man. First, we see a large glass jar which holds the ninety-six pounds of water which the body of the average-sized man contains. Next comes a bottle with three pounds of white of egg—albumen—nine pounds fourteen ounces of pure glue, thirty-four and one-half pounds of fat, one pound of phosphate of lime, three ounces of sugar, one pound of carbonate of lime, one and one-half ounces of starch, seven ounces of calcic fluoride, six ounces of ordinary salt and six ounces of magnesium phosphate.

The case has another division, and this holds an array of bottles and cases which represent a man split up into his primary elements. These are ninety-seven pounds of oxygen, in volume enough to fill a case ten feet cubed; fifteen pounds of hydrogen, enough to fill under ordinary pressure five such cases; also three pounds thirteen ounces of nitrogen. All these gases are compressed into cases to save space. Then there is about a cubic foot of solid carbon, in front of which are ranged smaller bottles containing four ounces of chlorine gas, eight ounces of phosphorus, three and one-half ounces of sulphur, two and one-half of sodium, the same of potassium, two of magnesium, one-tenth of an ounce of iron and three pounds thirteen ounces of calcium.

To this must be added three and one-half ounces of fluorine in combination, for it has never yet been obtained pure, and a minute quantity of almost every element which the earth contains—silver, copper, gold, lead, arsenic, lithium, etc.—all of which are contained in the body of a man.

AT a recent meeting of the Sheffield Society of Engineers and Metallurgists, says the London *Machinery*, Professor T. Andrews spoke on the microscopic internal flames inducing fracture in steel. For many years he had been engaged in researches respecting deterioration by fatigue in metals. He said that if it were possible to produce a perfect metal, theoretically, there should be no deterioration by fatigue. He dealt with the causes of many of the so-called fractures of steel engineering structures. It was shown, by approximate actual micrometer measurements made by Mr. Andrews, that an ordinary railway axle is composed of about 2,313,178,300 primary crystals, the latter often being again subdivided into a still larger number of secondary crystals. He pointed out that many fractures in steel are due to the presence of innumerable internal micro-flaws in the metal, caused by the presence of very minute quantities of sulphur and other impurities. Sulphur was shown to be the most dangerous element in producing these micro-flaws, owing to the formation, during the solidification of large masses of steel, of sulphide of iron, which, on the final crystallization of the metal, located itself between the ultimate crystals of the steel. The deleterious influence of other impurities, such as phosphorus and silicon, was dealt with.

WITH the system of measuring the velocity of projectiles at present in vogue, it is necessary to employ screens, which are broken by every shot, and must be replaced or mended every time a shot is fired, says *Machinery*. This is very troublesome. Dr. Purcell Taylor, of London, has perfected a screen which is perpetually ready, and automatically adjusts itself after every shot in preparation for the next one, while it is rather quicker in action than the old screens. Dr. Purcell Taylor has also perfected a continuously registering chronograph, somewhat after the pattern of the one

be brought out four years ago. With the new chronograph and screens it is now possible to take velocities at the muzzle, at the target, and at any number of points between them; and all this while you may be peacefully slumbering in the chronograph house. It will also take velocities on continuous discharges of a machine gun.

Mechanical Progress.

Use of Compressed Air in Foundries.

The application of the air hoist to cranes may be made in an almost endless variety of ways to meet the requirements of foundries. The most common types are simple cylinder hoists, either vertical or horizontal, or in combination with a low-pressure hydraulic system. In many instances direct-acting hoists may be readily applied to hand-power cranes already in use without in the least interfering with the gearing, and at a very small expense. There is no noise, no jar, and the load is always balanced. In foundries where an overhead traveler cannot be installed, air hoists suspended from trolleys running on an overhead track answer very satisfactorily; and if hose couplings, similar to those used in connection with the ordinary air brake, are provided, by simply attaching the hose connection after the load is raised, the hoist may be run on the overhead track to any desired part of the establishment. This, says the *American Manufacturer*, is especially valuable in conveying flasks outside of the foundry to storage sheds, patterns to the pattern shop or finished castings to the machine shop. Air used in combination with a low-pressure hydraulic system gives the best results for heavy loads. By interposing the water between the elastic medium, air, and the load, we eliminate that element of danger which otherwise would be present in handling vessels of molten metal, as in foundry practice, and also obtain a sort of elastic positiveness which is so essential and desirable. In the actual work of molding, as in lifting copes and molds, drawing patterns and moving cores, the men are enabled to do about 50 per cent more work, and do it easier and better when equipped with a hydro-pneumatic hoist. Included in this percentage is the saving in repairs and the danger of losing castings.

In addition to operating movable hoists, air has proven its value for conveying pig iron to the top of the cupola, and for breaking up scrap by lifting a heavy weight, which is dropped some fifteen or eighteen feet. This pig-breaker broke three half pigs into three pieces each in one minute, and can easily break twenty tons of pig while a man is breaking up one ton by the old sledge method. A portable pneumatic drilling machine, for boring holes to weaken stiff castings, is used to advantage in connection with this breaker.

Cantilever Bridges.

The origin of the word "cantilever" is somewhat obscure. In modern engineering, a cantilever, strictly speaking, denotes a girder fixed at one end and otherwise unsupported. For convenience the collective term "cantilever bridge" is applied to a structure of which a cantilever proper forms a component part.

The first iron bridges of this type were built in 1876, although their advantages, under certain conditions, had been recognized at an earlier period.

The cantilever type of bridge seems destined to occupy a field intermediate between that held by the simple truss for moderate span lengths and that which will probably be covered by some form of suspension system for spans above 1500 or 2000 feet.

The conclusions as to the comparative merits of cantilever and non-continuous trusses and to the conditions affecting their relative cost, briefly summarized, are as follows:

For moderate span lengths, cantilever bridges are, under ordinary conditions, uneconomical compared with non-continuous ones, owing to (*a*) increased weight of anchor trusses and (*b*) added cost of shore anchorages in cantilever bridges of the Niagara type.

These advantages are balanced in part by the following favorable features: (*a*) Decreased weight of trusses in the cantilever arms and suspended span, as compared with simple trusses equal to their aggregate length; (*b*) decreased cost of erection.

For moderate span lengths a net comparison will show an economic advantage in favor of simple trusses, unless local conditions are such that the construction of false works would be attended by extraordinary expense.

With increasing span lengths certain advantageous features of the cantilever system become more emphasized, until a limit is reached, beyond which well-designed bridges of this type are more economical than simple trusses with the same arrangement of piers, aside from advantages incidental to their method of erection.

How Mineral Wool Is Made.

Of those who know mineral wool, or silicate cotton, as it is sometimes called, probably only a small number are familiar with the simple process by which it is made. The wool itself, serving a variety of useful purposes, as a non-conducting covering against heat and cold alike for steam pipes and cold-storage room walls, as a sound deadener in floors and buildings, and as a means of fireproofing, is, as its name implies, a soft and woolly substance, consisting of a mass of very fine mineral fibers interlacing one another in every direction, and thus forming an endless number of minute air cells. The wool appears on the market in a variety of colors, principally white, but often yellow or gray, and occasionally quite dark, and is made by converting scoriæ and certain rocks, while in a molten state, into a fibrous condition by a steam blast directed against the liquid material. Blast-furnace slag forms the raw material for one variety of the wool and sandstone for another, yielding, respectively, slag wool and rock wool, the latter being preferable for pipe covering, because of the absence of sulphur, which, with moisture present, becomes an active corroding agent. The furnace slag or the rock, as the case may be, is melted in a large cupola, and as it trickles out at the tap hole in a somewhat sluggish stream it meets a high-pressure steam jet which atomizes the woolen material, if it may be so termed, blowing it in fleecy clouds into the storage room provided for it. Soft and downy, the stuff settles wherever a resting place offers itself, the heavier wool coming down first, while the lighter portions are blown further along by the force of the steam and settle in the more distant parts of the room. The material thus naturally grades itself into varieties of different qualities. One thousand pounds of wool per hour are turned out by one of the cupolas; and after the storage room has been blown full, the flocculent mass is pushed into bags, ready for the market. The whole process affords an admirable and interesting illustration of the utilization of a formerly waste product.

Among the papers contained in the last volume to hand of consular reports issued by the State Department is one on the "Use of Tactorium in Europe," comprising answers from several consuls to the department's request for information on the subject. Tactorium consists of a galvanized iron web covered with a gelatinous substance, and is translucent, but not transparent. It is described by a manufacturer as a substance that (1) can be bent without being broken; (2) is both tough and flexible; (3) is not softened by the rays of the sun; (4) is non-soluble; (5) is not affected by severe cold; (6) is a bad conductor of heat; (7) is well adapted for roofs, on account of its extreme lightness; (8) when exposed to the sun it loses its original yellowish color in time and becomes harder and more durable; (9) can be made by a very cheap process to imitate stained glass in such a manner that it cannot be recognized from the genuine article; (10) can be cut by shears nailed to wood and transported without danger; (11) can be easily repaired in case it is cut; (12) does not break; and (13) is well adapted for factory windows and skylights for hothouses, market halls, verandas, transportable buildings and for roofing. The consuls state that it is sold in small quantities in a few places, but that it is not known to the general public, and as a commercial product is still an experiment.

Practical Information.

Electing a President.

The aggregate number of electors this year will be 447, of which a majority is 224. These are divided as follows: Alabama 11, Arkansas 3, California 9, Colorado 4, Connecticut 6, Delaware 3, Florida 4, Georgia 13, Idaho 3, Illinois 24, Indiana 15, Iowa 13, Kansas 10, Kentucky 13, Louisiana 8, Maine 6, Maryland 8, Massachusetts 15, Michigan 14, Minnesota 9, Mississippi 9, Missouri 17, Montana 3, Nebraska 8, Nevada 3, New Hampshire 4, New Jersey 10, New York 36, North Carolina 11, North Dakota 3, Ohio 23, Oregon 4, Pennsylvania 32, Rhode Island 4, South Carolina 9, South Dakota 4, Tennessee 12, Texas 15, Utah 3, Vermont 4, Virginia 12, Washington 4, West Virginia 6, Wisconsin 12 and Wyoming 3. The Territories and the District of Columbia, which have representation in the nominating conventions of both parties, have no voice in the electoral college. The electors of each State meet at the capital of the State "on the first Wednesday in December in the year in which they are appointed," and cast the vote of the State for the candidate of the party by which they were elected. In case no candidates receive a majority of all the electors, the House of Representatives shall elect, the vote being taken by States, each State casting one vote.

When the electors meet in their respective States and cast their ballots for President and Vice-President, "they shall make distinct lists of all persons voted for as President and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify and transmit sealed to the seat of government of the United States, directed to the President of the Senate." On the second Wednesday in February succeeding the meeting of the electors in the several States, Congress shall, in joint session in the Hall of Representatives, the President of the Senate presiding, open the certificates, count the votes and declare the result, if either candidate shall have a majority. In the event that neither candidate has been elected, the House of Representatives elects the President, being limited to the three candidates having received the highest vote of electors, and the Senate elects the Vice-President, a majority of the whole number being necessary to a choice.

Resin, or crude turpentine, is the material obtained by tapping or bleeding the trees. Spirits of turpentine is the liquid obtained by distilling the crude resin. Rosin, or colophony, is the residue after the distillation of resin. Common pitch is the residue from the dry distillation of rosin. Brewers' pitch, which is used for coating the interior of beer kegs and barrels, is obtained by stopping the distillation of resin before all the oil has been distilled. Tar is produced by distilling the wood itself, and oil of tar is obtained by distilling the tar. Each of these articles is separated commercially into several different grades, and every grade has its own name.

A French company has obtained a permit from the Chinese Government to prospect for minerals in the province of Tse-Chuen, near the frontier of Tibet. A geologist and several engineers left Shanghai in July on their trip into the interior. The distance from Shanghai to Tse-Chuen is 2000 miles and cannot be covered under three months. The party will travel by river, up the Yang-tse-Kiang, the Kialing and Mow-Kna rivers.

Money of the World.

The Philadelphia *Press* says: "The money of the world is distributed as follows:

Countries.	*Gold.*	*Silver.*
United States*	$600,100,000	$325,600,000
United Kingdom	580,000,000	115,000,000
France	850,000,000	487,900,000

*July 1, 1896; all other countries, January 1, 1895.

How Piling is Driven in Bavaria.

Henry A. Carpenter, United States commercial agent at Furth, Bavaria, writing of the opening in that country for American manufacturers, says:

"The manner of driving piling here would indeed, make an American contractor smile. The method is as follows: A simple block and fall arrangement is rigged up over the pile and to the end of the rope running the pulley and fastened to the weight is about twenty-five smaller ropes with hand pieces. Twenty-five men grab these and at a signal from one of their number, all pull together. The weight goes up about eighteen inches or two feet, when the men relax their hold and the weight drops. It is unnecessary to state how long it takes by such a method to drive a pile, or how much more effectively a small dummy engine would do the work. In the erection of buildings the same tedious process is employed; for every stone to be raised requires the strength of a pair of horses and about fifteen men tugging away at the ropes. The machinery manufactured and used in America for such purposes would do away with this clumsy method, but none of it seems to be in the market here."

According to President Tyler, of the Society of Chemical Industry of England, twenty years ago Great Britain was the largest producer of plate glass; then followed France, Belgium and Germany. Now, mainly in consequence of the action of protective tariffs, the position is reversed, and England takes the last place, the first being the United States, followed by Belgium, France, with Germany about equal to England.

A well-known medical authority says in a recent work that cheese should be eaten at least once a day. "It is the most valuable animal food obtainable," he says, "from two to three times as nutritious as the same money value of ordinary meat."

Mining Summary.

CALIFORNIA.

Amador.

The Pocahontas Improvement Company, a company organized in West Virginia to work the Pocahontas mine at Drytown, is seeking a contract for sinking a double-compartment shaft 600 feet deep. Preliminary work was commenced several days ago.

Ledger: The Clearwater, in the Pioneer district, lately bought by J. A. Greenwood, shows a two-foot ledge of good ore.

The Kelley mine is being opened up under the management of the new owners.

G. P. Rixford of San Francisco has secured the Smith interest in the Reward mine near Pine Grove and intends to put in a new mill of ten stamps in place of the old one.

Dispatch: It is understood that work will soon be resumed on the Contention quartz mine.

A strike has been made in the Argonaut mine of ore of good milling quality.

In the Blue mine near West Point a good prospect was found at a depth of fifteen feet and at seventy-five feet paying rock was taken out.

Prospect: The Sheffield Consolidated mine which is owned by the same syndicate as the Hexter, in a four day's run yielded $900. Three tons of sulphurets shipped to Selby's smelting works netted $100 to the ton.

Republican: The Bellwether shaft is now down 156 feet and 200 feet more will be sunk.

Work at the Jackson Gate mine is being pushed along rapidly. The shaft is now 300 feet deep.

Butte.

The old mining ground of Hansonville, near the southern line of Butte county, is proving as rich as it was in early days. The pay is in a narrow strip of decayed quartz not more than two inches wide, with occasional pockets.

W. Greenleaf and his son are sinking a prospecting shaft on the Lloyd place, on the site of the old mining town of Lynchburg. They expect to strike good pay gravel at a depth of twenty feet.

In the Mt. Ida quartz mine the shaft is down 50 feet; ledge 24 inches. Four men are employed. The new 5-stamp mill is crushing quartz.

At the Standard mine work is resumed under a new company composed of Oregon City business men, who will work the mine under different management.

At the Magalia mine there are 45 men employed; the mine is reported as paying handsomely.

The English Company has 25 men at work on Butte creek.

E. C. Paxton, superintendent of the Peter Woods mine near the Forks of Butte, has 35 men at work digging roads and getting things in shape to put machinery on the mine. This mine is owned by the English syndicate.

Register: E. C. Paxton of the Peter Woods mine, near the Forks of Butte, has thirty-five men at work digging roads and getting things in shape to put machinery on the mine, which is owned by the English Syndicate.

San Francisco people are at work developing the Ramona mine and expect to have a mill running within sixty days.

T. H. Lawton is opening a new quartz mine about two and a half miles from Enterprise and on what was formerly a very rich stream, Powell creek.

Calaveras.

Prospect: At the Rising Star mine near Central Hill, a shaft to tap the channel ran into gravel last week that prospects well. The property is being worked under a bond by W. H. Snedaker and J. T. Sullivan. New hoisting machines will soon be on the ground.

Chronicle: At the Soap Root mine sinking is going steadily on, a good ledge of rich rock still showing in the bottom. This company has purchased a gravel claim on the Middle Fork and piping will soon commence.

At the Crown Point mine at the head of the Calaveras river the owners propose to enlarge the shaft to 8x8 and continue sinking.

At the Keystone mine sinking is being prosecuted rapidly, eight hour shifts being employed. There is a 3-foot ledge in the bottom of the shaft of ore that assays well.

It is reported that the Petticoat mine will soon start up.

Del Norte.

Eastern men are in Waldo looking at the copper prospects owned by the Baltimore people, who took machinery in last summer to be used in the extraction of the ore.

The Coon Mountain Gravel Mining Company have 20 men at work. They will probably employ 50 men before winter sets in.

Three copper mining men from Grant's Pass visited the Low Divide country and located two water rights.

Happy Camp and vicinity is reported to be the liveliest mining section in Siskiyou county. Sales of mines in that section to Eastern and Colorado capitalists have brought this about.

El Dorado.

(Special Correspondence).—Graeter, Cook & Elvige are preparing for the erection of a 10-stamp mill on their gravel claim, one mile south of here. They will operate on the same well-defined channel from which the Franklin is making its regular monthly bullion shipments.

J. H. Bradley reports that he will at once resume work on the Eagle Company's 700-foot tunnel near Grizzly Flat. The ledge is said to be 7 feet, of good ore.

Channel mining is receiving considerable attention. Two large properties were recently bonded, within a short distance of town, upon which development work is to be begun shortly.

Eight men are at work on a bar in the Cosumnes river, twenty-two miles east of Placerville. They are 10 feet below water level. The peculiar formation of marble and copper-bearing ore, mingled among the boulders and gravel, is an interesting study, as they are found in the chimneys of the bar.

Hank Roberts is developing three ledges at Henry's Diggings, twenty-five miles southeast of Placerville. The ore bodies, though small, are said to be high grade.

Melton & Roberts are diligently pursuing development work on the Rosebud, a few miles above Fairplay.

A party of five are fluming the American river about three miles from town, in the neighborhood of Chili Bar, famous in its history for rich production of coarse gold.

New life is manifesting itself in mining interests in the famed Kelsy district, six miles north of Placerville. Two capitalists have put prospectors to work on several pieces, some on new and others on old-time quartz ground.

Development work on the copper property bonded by Head & Bind is progressing in a satisfactory manner. The second tunnel has reached about 80 feet, passing through a formation of crystallized limestone.

It is creditably reported that the Anti-Debris Association has withdrawn its objections in the Mulky Spreckels case. This being the case, and a permit having recently been obtained from the commission, work will be resumed without delay.

Placerville, Cal., August 31st, '96.

The Stanley gravel mine at Smith's Flat hss been started up.

Inyo.

Register: Sanger and Danielson, of Big Pine, have returns from assays of copper ore samples from their lead east of Keeler, thirty miles. The lead is 75 feet wide and shows a good percentage of copper.

Kern.

The old Rocheford mill is being put into shape for running work.

The Burton Brothers have developed a ledge from thirty to forty feet wide on Piute mountain, near Mojave. They milled seventy tons that brought them $14 a ton.

The Warrenton mine, near Kernville, is to be thoroughly developed before any of the ore is milled. Three shifts are sinking a shaft and the 300-foot level will soon be reached. Thus far $22,000 has been expended on this mine.

A ten-stamp mill is crushing ore for the lessess of the Big Blue property, and the rock is turning out well. All the men are subject to a twenty-four hours notice to move, and should the mine be sold, the purchasers can take possession and proceed with the work the next day.

The new Tremain stamp mill at Garlock is up and ready for work on a quantity of Burcham, Mooers & Singleton ore.

A tailing pond is being scooped out in the wash below Garlock for the reception of the Rand Mining Company's slickens. Sluice boxes with blanketed bottoms have been put in, and it is argued that the saving in gold by this method will equal that of the best concentrators.

The machinery for the Rand Mining Company's pumping plant has arrived at Goler and is being set up. Water is coming into the shaft so fast that it cannot be bailed dry and pumping must be resorted to. The water supply is assured and the new forty-stamp mill will be put up at once.

Dry washing at Goler and back of Garlock is slightly on the increase.

Lassen.

Mail: The Hayden Hill Gold Eagle Mining Company have their shaft now down 325 feet and have given a contract to sink 110 feet farther. From the 220-foot level 20 to 25 tons of ore a day is being taken out to their two 10-stamp mills on Willow creek.

For the Hayseed mine a new 10-stamp mill has been erected on Willow creek.

The Blue Bell, one of the oldest locations at Hayden Hill, has been reopened.

At the Big Tunnel mine the tunnel to penetrate Hayden Hill is now in 1424 feet. A small vein carrying a few colors is occasionally cut, but nothing has yet been encountered which would justify developing. The tunnel will tap a region much deeper than any other developments made, and the result is anxiously looked for.

Mariposa.

Miner: Walser and Dunn, of Fresno, who have the property of Michael Dugan bonded, are opening up the mine. They are working on the hanging wall with a well defined ledge and are also running a tunnel at the foot of of the hill to cut the ledge at quite a depth.

Development at the Horseshoe mine near Hunter's valley is progressing, the new shaft being sunk as rapidly as powder and steel can sink it.

The mine recently bought by John Rosenfeld & Sons, of San Francisco, situated near the old Sampson ranch, has ceased operations for a while.

At the Dorse mine the main shaft is down about 300 feet, besides several drifts run each way on the vein.

San Francisco people are running a tunnel in the vein to develop the Burnett & Dabney mine at Sherlocks.

Mono.

Union: Much work is being done at the Jordan mines preparatory to the erection of a 40-stamp mill. Bridgeporters may soon look for the arrival of teams with machinery, etc., for that camp. It will be a bonanza for teamsters, as there will be about 250 tons, more or less, of freight to come in from Carson.

The Standard Con. M. Co. will erect another electric plant on the river a few miles below Bridgeport.

Nevada.

At the Cadmus mine, on Deer creek, opposite the Champion, some rich ore has lately been struck. The shaft is now down 260 feet and is being sunk as rapidly as possible. It has not yet been decided whether the west drift will be started at the 300 or 400 level.

Work is progressing favorably at the Home mine on Deer creek, near the Cadmus.

The loss by fire at the Providence mine has been appraised at $7000. The loss of gold can not be estimated until a cleanup is made. The contract to rebuild the works has been let to W. Marsh.

Transcript: Negotiations have been pending for some time for the sale of the South Idaho mine in Nevada county, and a few days ago a telegram was received from Buffalo, N. Y., stating that the sale had been closed.

Three carloads of machinery and two cars of cement have been received at Colfax for the Allison Ranch mine at Grass Valley. Five carloads of machinery are yet to follow from San Francisco. When thoroughly equipped this mine it is claimed will work a force of 300 men.

Tidings: Work has again been commenced on the old Pennsylvania mine, in Brown's valley. The property includes the two Pennsylvanias and the Jefferson which years ago paid nearly $3,000,000 in dividends. The Webb Mining Company, who own the property, have lately erected a mill at a cost of $60,000.

Transcript: The Eagle Bird mine, near Washington, was bid in at commissioner's sale by the creditors for $3,285. There is a 30-stamp mill and a fine hoisting plant on the property.

Union: The Culbertson, at Graniteville, is working eighteen men and taking out good ore.

In the Live Yankee richer pay gravel has been found at the end of the additional 600 feet of tunnel that has been run lately.

The Red Dog Mining Company are making good progress at their gravel mine near You Bet. The incline shaft is now down about 90 feet it is expected that gravel will be struck at a depth of 180 feet.

Placer.

Sentinel: The tunnel at the Eureka Consolidated drift mine above Forest Hill is now in 1480 feet.

The force of men at the Mayflower mine has been increased to 75. The mill is running steadily. They are taking out good gravel at the south end and also in the Orono channel.

Plumas.

National-Bulletin: L. F. Tefft recently took a $50-nugget from the Concordia gravel mine, near Cromberg, in which he is opening up new ground.

At the Garnett, formerly the North American and Bunker Hill properties, there are at present employed about 60 men. A large part of this force is at work on the outside, preparing for the winter, cutting logs for an impounding dam, digging ditches, laying pipe for the hydraulic works and cutting timbers for underground work.

Independent: Judge Thos. E. Hayden of Reno has purchased from the Sierra Lumber Co. their half interest in the Hapgood & Black quartz mill situated near McLear's, in Mohawk valley, and is perfecting arrangements for water therefore, when, it is understood, the mill will be opened for custom crushing. He has also, in company with John Sparks of Reno, purchased from D. M. Bull an undivided one-fourth interest in the Verdi and Verdi Extension placer claims on Mill creek.

Riverside.

Fifteen of the twenty stamps of the Santa Rosa gold mines, in Riverside county, are at work and about forty men are employed.

San Diego.

W. W. Stewart, receiver of the Golden Cross Mining and Milling Company at Hedges, has filed a report in the Superior Court covering the period from the time he took charge of the property, June 7, 1896, to August 15th. Receiver Stewart states in his report that at the beginning of his receivership the 40-stamp mill was idle, but has been dropping almost constantly ever since. The total expenses of the company from June 8th to August 15th were $48,269.73. This included $26,548.43 paid to miners, etc., $13,485.09 for milling, $10,499.55 expended in construction, and $3,959.53 for general administrative and office expenses. The sum of $6,222.87 was realized from the stage, water account, house account, boarding house and store, leaving $48,269.73 amount expended. The total receipts reached $54,460.17, and included mint returns of about $46,286.18.

Bailey Bros., of Banner, have crushed 30 tons of rock from the Redmond mine, which went $80 per ton.

At Picacho Deputy Sheriff Johnson levied an attachment on the California Picacho Gold Placer Mines Company's pumping plant and placer mines, which belong to the Picacho Gold Placer Mines Company, Limited, of London.

At Picacho the Golden Dream Mining Company has 7 men at work on its mines, which are situated in the Old Providencia mining district on the Colorado river, below Picacho. The men are paid every Saturday and the contractors when each shaft or piece of work is completed. The Golden Dream Company has secured the Alcyon and the Yellow Gold group of mines—fifteen in all—and will put up a new mill this fall.

The New York company that purchased the Dr. Jayne group of mines has had an estimate made of what it will cost to put the mines and the mill into good shape for crushing 125 tons of ore per day.

An English company have a group of 21 mines in the Picacho basin, adjacent to the Goshen mine of the Jayne group, which they will open up when cool weather comes, and for the working of the ores of which they will put up a mill at the Colorado river.

Twenty miners are employed in the Red Cloud silver mines, five miles from Picacho.

Shasta.

Courier: The new ten-stamp mill for the Roberts group of mines is en route to the Gulch and will soon be put up. The engine will have power to run forty stamps and these will be added when required.

The Iler Brothers own a group of quartz mines on Spring creek that they have put much development work on and which have large bodies of ore in sight.

Free Press: The new smelter of the Mountain Mines, Limited, will not be completed for two weeks, but work is going steadily on. The company has 340 men on its payroll and is distributing about $20,000 per month.

Searchlight: Mining news from Harrison gulch continues more and more exciting and many prospectors from Tehama and Shasta counties have gone there.

The great Sunny Hill tunnel is now in a distance of 350 feet.

L. Rhodes has disposed of some of his mining interests at Harrison gulch for $10,000.

The Trinity Consolidated will again start the mill on Dog creek and have in contemplation a tunnel from the mill to the ledge, cutting off all the surface work. Ore bodies already uncovered in the property, it is said, warrant the outlay.

Murray Bros., who recently came in possession of the old Murray and Hull properties above Shasta, have discovered a fairly rich ledge. The crosscut shows it to be 6 feet in width, 3 feet of which is paying ore, estimated to yield about $10 per ton.

Sierra.

The Sierra Gold Mining Company recently bought a mine above Downieville which they have proceeded to develop. They have purchased the 20-stamp mill on the Mt. Moriah mine between Forest City and Downieville.

Siskiyou.

Journal: The Garrett mine, near the mouth of Scott river, is running in full blast.

The Commodore mine, on Barkhouse creek, still continues to produce excellent ore, and the owners, Humphrey and Quigley, expect to make a better cleanup than ever next time.

A couple of tons of rock which was crushed from the Katie-May mine on Greenhorn, owned by Bailey & Carrick, went $100 to the ton.

The new 5-stamp quartz mill which is being erected by Chamberlain & Timmons on Mill creek, near Scott bar, is about completed and they will soon commence crushing the quartz from their mine, the Mabel. The Columbia, which is located on the same vein, is also producing good ore this year, which is taken to the Columbia mill, on Mill creek, for crushing.

The Gum Boot quartz ledge, owned by Simon Bros. & Co., has been worked this season by the owners. It is one of the largest ledges discovered in the past two or three years in the county.

Trinity.

The Poker Bar Mining Company has forty-five men employed and work in getting things in readiness for next season is being actively pushed. The machinery for the elevator is being put in place.

On the Hill mine on Coffee creek a mill with a capacity of twenty tons will soon be erected. The ore from this mine is free milling, running from $50 to $70 per ton. There are eleven men employed.

Tuolumne.

Independent: The Rawhide has received a new steel cable weighing some 2500 pounds.

The engine for the Shawmut hoist is on the ground and is now in course of erection.

The electric plant of the Santa Ysabel is almost completed and will soon be in active operation.

At the Bellview mine the 10-stamp mill is running regularly and stoping is in progress in the 400 and 500-foot levels.

The Soulsby mine is erecting a new hoisting works. Rails are also being laid for conveying the ore from the hoist to the mill. The new shaft is down 150 feet.

The Star mine, owned by the Wilman Bros., is having erected a three-ton furnace chlorination works, and will also shortly put in a four-drill air compressor.

Union Democrat: The big pump in the Confidence mine being worked under bond from Baker & Hamilton has taken out the water down to the 600-foot level. The lowest workings run down to 800. They have found on nearly every level bodies of good milling ore that was passed over years ago as being too low grade to work profitably. Ore that would not come near paying twenty years ago can now be handled at a big profit.

OREGON.

Mining Journal: W. A. Clark, the millionaire copper magnate of Butte, Montana, came in from the north and went out with Captain Brown to the copper ledges on the Illinois last week.

Jacksonville *News*: Flagstaff district, Baker county, is attracting considerable attention from the prospectors. The Bradbury Bros. have found a new ledge, 4 feet wide, near the Cyclone. Scott, Phillips & Kirk have a 6-foot extension of the Flaffstaff. H. S. Bowen and J. M. Lachner have bonded the Sound Money group to Chicago parties. The Red Jacket is showing ore assaying from $10 to $30 gold.

G. R. Hammersly & Co. of Gold Hill are wingdaming the Rogue river at that place.

WASHINGTON.

Post-Intelligencer: The Swauk placer mining district, the oldest of its kind in the State, is developing into a quartz district, and side by side with the bedrock tunnels and sluice boxes of the placers are twelve arrastras grinding free milling ore, which gives good returns.

Spokesman-Review: In the Okanogan district there are more men working in developing the mining interests than since 1892.

BRITISH COLUMBIA.

Spokesman-Review: The Crown Point mine in the Rossland district has been sold to a Toronto syndicate for, it is said, $230,000. They propose to expend $75,000 more in devel-

opment work. The same syndicate has been given an option on a bond on the Robert E. Lee and Maid of Erin.

The new discoveries recently made near Christina lake, in the Boundary creek region, are attracting considerable attention to that section.

Advices from the outlying districts of Murphy, Sullivan and China creeks are that numerous prospects, upon which development work is being done are showing up wonderfully well.

A new mill in the Noble Five will be in operation Nov. 1.

The Novelty mine in the Rossland district has been sold for $17,500 to a syndicate represented by John R. Reavis.

The Spotted Tail group of mines lying near the Crown Point has been sold to a Montreal syndicate for $8000.

The Chicago and Montana Mining Company, of Libby, Mont., are driving a 200-foot tunnel on the face of their old one and are running a new 150-foot tunnel on the air shaft and putting in a 70-horse power steam engine.

Post-Intelligencer: A rich strike is reported in the Silver Belle group in the south belt lately purchased by a capitalist from Everett. A vein 12 feet wide of steel galena, carrying gold, assays very well.

Two cars of ore, the first shipment from the Apex mine on Money creek have been sent to the smelter. Packing the shipment to the railroad was $12 a ton, a little over $500.

Charles P. Oudin has bonded the Debs, Emma R. and Prince of Wales mineral claims, adjoining the R. G. Sovereign on Lookout mountain near Trail, for $30,000, 10 per cent down, the balance in three, six and nine months.

At the Van Anda mine on Texada island 100 tons of copper ore is ready for shipment and the owners claim that they will continue to send ore to the smelters regularly. The assays are claimed to be high in copper with a little gold which increases as they go down.

Nelson *Miner:* Some new locations have been made on Upper Arrow lake that assay high in gold and silver.

Continued finds are reported from the north fork of the Salmon as well as from many other parts of the district.

A 3-foot vein of carbonate and galena has been discovered on Thompson and Sutro's claim near Sandon. The mine is within 500 feet of the railway.

The War Eagle is shipping about 30 tons of ore a day to the Trail smelter.

A strike of highgrade ore has been made on the Mugwump. This fractional claim lies between the City of Spokane, Pilgrim, Iron Mask and Virginia.

The new main shaft of the Le Roi is nearly down to the 500-foot level. The ore that is being taken from this shaft is the richest that has yet been found in the mine. It is a fine grained chalcopyrite with little or no gangue matter.

Kootenaian: Some men sent out by Kaslo people in the Duncan river have made a discovery of free milling ore that they claim will go $20 per ton and the ledge is said to be 40 feet in width.

Ore has again been struck in the lower tunnel of the Enterprise, and the ledge is widening and improving.

The Nelson *Miner* gives the following data as to the output of Kootenay mines:

ORE TREATED IN KOOTENAY.

At Nelson	19,114	
At Pilot Bay	19,119	
At Trail*	9,606	
		47,839

ORE EXPORTED.

From Slocan via Kaslo	6,951	
Slocan via Nakusp	4,863½	
Ainsworth	311½	
Trail Creek (gold ore)	5,154	17,280
Tons		65,119

* In addition 505 tons of imported ore have been treated at Trail.

PRODUCE OF SMELTERS.

	Tons.
Nelson (Hall Mines) Matte	1625
Pilot Bay, silver lead bullion	1012½
Trail Smelter	1052
	3689½

Rossland *Miner:* The Phœnix Consolidated Mining Co., with a capital stock of $750,000, has recently been formed to work the Phœnix and other properties on the north fork of Carpenter creek.

Ore has again been struck in the lower tunnel of the Enterprise, and the ledge is widening and improving. The mineral is left standing in all the workings.

L. W. Northey, representing a syndicate of New York men, has taken an option to bond at $75,000, for a year, either one of two groups at the head of the north fork of the Salmon river. One group consists of the Secretary, White House and Senate, known as the White House group, and the other, known as the Deserter group, consists of the Deserter, Blue John and Bornite.

In the North Star mine, on Huckleberry hill, the ore is galena, which averages from 55 to 100 ounces in silver and 68 per cent lead. This company has shipped about 5000 tons this season and there are at least 100,000 tons in sight at the present time.

The Mount Adams group is reported bonded to Philadelphia capitalists for $110,000. Work was commenced on them a few days ago. These properties are owned partly by Captain R. C. Adams.

ALASKA.

News: At Funter Bay the new mill of the Alaska-Willoughby Gold Mining Company is crushing about 40 tons of ore per day. The cleanups have been very satisfactory. Development work is being prosecuted simultaneously on several of the claims, several of them lying in such position along the beach as to be available with one line of track.

On the Mountain group, over the Willoughby property, a force of men is kept constantly at work since the sale of the group was affected some months ago by Geo. and Chas. Garside. The company that bought these claims, said to be a Boston syndicate, it is thought are desirous of securing control of the Willoughby claims and mill with the purpose of increasing its capacity to handle ore from both groups of claims.

UTAH.

Tribune: P. Conley and others of St. Paul, Minn., have purchased the Hawkeye of Park City. It is their intention to perfect the machinery with which work was previously done in the mine and to begin extracting ore in a few weeks.

The Mingo smelter will be closed down as soon as the ores now on hand are worked up.

Contractors have begun the work of improving the Sacramento mill at Mercur.

The Marion has a new vein which is quite rich. It lies immediately on top of the silver vein, and about 200 feet below the gold vein.

The Wonder shaft is down 380 feet and is still in a hard limestone formation.

The final payment of $10,000 having been made, the title to the Golden Gate Extension is now clear, and the company will continue its exploration with every assurance that at a depth of about 400 feet the ore body will be encountered. At present the shaft upon the Golden Gate Extension has attained a depth of 125 feet.

It is announced that the Hanauer smelter would start up again early in September.

The Ajax Mining Company will early next month put through the Sioux mill 200 tons of ore for the purpose of determining the best method for milling it. It is claimed that there are now 200,000 tons of milling ore blocked out. The company will commence the erection of the mill as soon as experiments are completed.

At Park City the Peck Concentrating Company has closed a contract with the Anchor company for the big tailings dump lying at the Anchor concentrator, and that will be the first dirt handled by the new mill when completed. The method of moving the dump to the mill proposed is a pipe-line, the dump being composed entirely of very fine material.

The Silver King Company will increase the number of its employees early this month.

The Daly West Company's new hoisting plant is now in active operation and work through the shaft begun.

At the Comstock mine at Park City to handle and extract the ore economically there is now being driven into the hill a tunnel to connect with the vein. It has been run a distance of 2000 feet already, and is now in the body of silver and lead ore for which the search has been made, and if shipments are not made in the next few weeks it will be on account of the ruinously low price of silver and lead.

The Northern Light at Bingham has suspended shipments owing to the low prices prevailing in the metal market.

Work progresses steadily on the Hoogley mine at Bingham. It has uncovered some very high-grade ore.

The Ophir Hill Mining Company at Ophir is producing 1000 tons a month, notwithstanding the depressed condition of the metal market.

R. H. Cavell is opening up the Buckhorn, that many years ago was among the most prominent of Ophir's properties. The ore at that time occurred in high-grade chambers, and the opinion is expressed that with exploration they will be found again.

IDAHO.

The prospects for increased activity in the Pierce City districts grow both in placer and quartz mining. On Reed's creek a company are opening up a large placer claim, and have 25 men employed. The American Placer Mining Company, after expending $30,000, have commenced washing pay dirt.

The Bingham Placer Mining Company has oraganized at Salt Lake, Utah, capital stock $250,000, to handle 5000 yards of gravel a day. A complete hydraulic plant will be put in.

Preparations are being made to work the gravels in St. Joe basin on an extensive scale. Allen, Sutherland & Wendel have secured claims in there aggregating 440 acres, together with all the water rights necessary, and will begin building ditches soon.

Avalanche: Steam was raised lately at the Henrietta hoist, for the first time in eight years. It is now started up under a new organization and is to be known as the "Big I."

MONTANA.

The waters of Grasshopper creek, in Beaverhead county, are being worked with new methods for the gold that lies within their sands. Two companies organized in Chicago, with eastern capital, are dredging the creek and operating a centrifugal pump, and both are believed to be making a great deal of money.

The machinery is on a boat in the creek, floating in 35 feet of water. The pay gravel is raised from the bottom of the river by a series of buckets running on two heavy iron rods that are set on a swivel. They are hung on knuckles so that as they rise to the top they empty themselves into a grizzly. That separates the gravel from the sand, and the remaining material is raised to the sluice boxes on the top of the boat. The enterprise represents an outlay of $100,000, but it looks as if the money would be taken out of the creek before the season was over.

SOUTH DAKOTA.

The Union Hill Mining Company have started fires in their smelter and commenced treating ores. Development work on the mines has resulted in the opening up of hitherto unknown ore bodies.

The 20-stamp mill, formerly known as the Hildebrand mill, has been purchased by P. L. Gibbs to work on ore from the Omega mine, situated on the divide between Terraville and Central.

Black Hills *Times:* The ore shoot now exposed in the Tornado workings shows a breast 300 feet wide and from 5 to 9 feet thick, from which a daily average of 150 tons of pay ore is extracted. The property is owned by the Golden Reward Company and could supply a plant of 500 tons daily capacity just as readily as it does the present one of 125 tons.

The Pluma M. & M. Co. have men at work putting the mine and mill in shape to resume operations, and in a few days both will be running. The mines of the company adjoin the property of the Homestake and Hawkeye Mining Companies.

A geological survey is to be made of the siliceous ore belt in the vicinity of Portland, Squaw Creek and Upper Spearfish under the direction of the State School of Mines.

The Union Hill M. Company have their smelter and stamp mill in operation.

Miner: Work has been begun on the cyanide plant at the Keystone mill, which will have a capacity of 10 tons.

WYOMING.

George Moyer is building a cupola in the mining belt on Casper mountain to smelt copper ore mined there and will use a flux made from natural soda.

D. J. Sheean of Caspar has discovered a vein of asbestos on Ferris mountain. He will submit samples of his discovery to experts in order to ascertain its commercial value. The samples indicate that the product is equal to the Canadian asbestos.

COLORADO.

Denver *Republican:* At Cripple Creek a strike has been made in the Granite Hill. Two feet of the ore gives above $250 a ton on sample assays, while picked specimens showing free gold run much higher. From the strike of the vein it is thought to be the extension of the one opened at the El Paso in excavating for a power plant.

Smith & Fogleman having forfeited their $35,000 bond on the Keystone, on Gold hill, Miles McDonald, the owner, gave C. B. Gentry a new bond running for one year in the sum of $65,000.

During the past 36 years the following mines of Gilpin county have produced more than $1,000,000: The Gregory-Bobtail, over $17,000,000, has now 1800 feet of vein matter exposed and ready for extraction, and was recently sold to a syndicate of English capitalists for $1,050,000; Gunnell mine more than $4,000,000, and is still being worked; California over $4,000,000 and is producing regularly; Perigo more than $3,000,000 and, after a long period of idleness due to litigation, is again in operation and producing; Burroughs has produced more than $3,000,000 and is still taking out ore; Hubert & Prize vein over $2,500,000 and is producing heavily; Kansas more than $2,500,000 and is still turning out ore; Bates vein more than $2,000,000 and is still a producer; Fisk over $2,000,000 and is still being regularly worked at a profit; Saratoga over $1,000,000 and is one of the heaviest producers in the camp.

NEW MEXICO.

Spiller & McLean are working 20 men on the Pacific Gold Company's claim, on the Pacific lode, and shipping the ore to the 10-stamp mill at Silver City.

At Carlisle the Steeple Rock Mining Company are employing 120 men on the various mines. Ninety of them are Mexicans and about thirty Americans. Ten stamps in the big mill are all ready to start, but it is not probable the mill will be started till after election.

At Mogollon the Confidence mine is the only one now running in the camp. Ninety men are employed. A large proportion of the labor is being done in development work. The development below the main adit level is showing up as well as the great ore bodies above.

Silver City *Enterprise:* The Bayard Mining and Milling Company of Central City, New Mexico, has been organized with a capitalization of $600,000, to work seven properties in the Central district, including the Texas mine. New York and Philadelphia capitalists are the organizers.

The new firm which owns the Dorsey gold properties is driving an adit level upon the Talcose mine. The owners intend to develop the property, and, if it proves as good as the surface showing indicates, a mill will be built.

ARIZONA.

Journal-Miner: At Santa Maria the Goodenough has been sold to an English company.

At the Gold Standard tunnel No. 1 has been driven in 200 feet in the vein and shows ore all the way.

Throughout Turkey creek district the hills are said to be full of prospectors.

The new 100-ton smelter furnaces for the Old Dominion Mining Company are on the way to the mines.

MEXICO.

At El Pomo, in the Alta district of Sonora, the new mill of the National Mexican Mining and Development Company has started up. It has a capacity of thirty tons daily. The product is running from $180 to $300 per ton in gold. The company owning and operating the property is a Chicago concern in which the Armours are interested.

Nogales *Oasis:* Colonel Waddell of New York, representing a syndicate headed by F. J. Lancaster of No. 2 Wall St., N. Y., has closed a deal by which there passes into their hands the Esperanza and Francisco mines, in the Magdalena district of Sonora. Reports were made by Ignacio Bonillas of Sonora and John Farish of Colorado. The properties are well developed, having over 2000 feet of shafts, tunnels, drifts and winzes, exposing, it is claimed, over 200,000 tons of ore. A 20-stamp mill will be erected. Several carloads of machinery for it are now at Nogales.

LOWER CALIFORNIA.

The *Union* says the owners of the Cedros Island mines have completed plans for putting in an immense plant on the island. G. E. M. Pratt of Chicago and J. H. Denman, representing the English investors in the new enterprise, are now in Chicago, after a visit to the mines. They left Superintendent Eames and a party of mining engineers on the island, where six weeks will be consumed in making preliminary surveys and perfecting plans for work. The company will build a 40-stamp mill by the sea shore and will put up a cable tramway to carry ore from the mines to the mill, a distance of from one to two and one-half miles. The mill will be so built that it can be doubled or trebled in capacity with no extra expense for building or foundation. If the ore can be extracted as easily as now appears probable, the mill will be increased to 100 stamps within two years. Sea water will be used for amalgamating purposes, and large condensers will provide fresh water for the boilers and for consumption by the miners, if found desirable. The company will also build or buy a gasoline schooner to ply between San Diego and the islands, to carry supplies and passengers. Altogether $150,000 will be expended by the company in establishing its plant. The process of working the ores will depend upon their character, as revealed in tests now being made. It is conceded that the ore is not free milling, and that some chemical process must be used. It will probably be cyanide. A vast quantity of ore is in sight, developed by the old company, and much of it is of high grade. Other ore which could not be handled profitably by the old company will be made to pay large returns by reduction on the ground. About 200 men will be employed when the work gets under full swing.

Lower Californian: At Agua Dulce the new 10-stamp mill of the La Fortuna Mining and Milling Company is crushing twenty-five tons of ore daily.

CANADA.

The summary of the mineral production in Canada, issued by the geological survey, shows 1895 to be the most satisfactory year as regards mining since the department began the preparation of its statistics in 1886. The figures of production for the ten years are as follows:

Year	*Production.*
1895	$22,500,000
1894	20,900,000
1893	19,250,000
1892	19,500,000
1891	20,500,000
1890	18,000,000
1889	14,500,000
1888	13,500,000
1887	12,500,000
1886	12,000,000

The value of gold production, compared with 1894, rose from $954,451 to $1,910,921; that of lead and silver from $597,441 to $1,908,599. There was also an increased production of copper and iron ore, the whole partially offset by a decline in the value of the nickel output from $2,061,000 to $1,360,000. Coal production fell off from 3,853,235 tons to 3,512,504 tons, and in value from $8,447 329 to $7,774,178, and this decrease, which is likely to be more than made up for in 1896, reduced the total value of non-metallic products from $15,921,000 to $15,875,000, not a very serious decline, it will be admitted, and which was more than compensated for by the increase in metallic products from $4,683,389 to $5,370,146.

AUSTRALIA.

Mining Standard: The following is an analysis of the results of the Croydon Quartz Crushing and G. M. Company's cyanide operations and shows cost of treating low-grade tailings at the largest works of the kind in Australia:

Duration of run (working days)	469 days
Corrected dry weight of tailings leached	37,387 tons
Weight of tailings leached per day	79.7 tons
Percentage of acid in ore	0.24 per cent
Water to remove acid per ton of ore	174 gallons
Average leaching rate (water and solution) per hour	0.93 inches
Sizing of tailings—	
Passing 40-mesh screen	90.2 per cent
Remaining on 40-mesh screen	9.8 per cent
Weight of bullion recovered	36,781.1 ounces
Weight of fine gold recovered	8,252.2 ounces
Weight of fine silver recovered	26,756.6 ounces
Cyanide consumed per ounce of bullion recovered	0.99 pounds
Zinc consumed per ounce of bullion recovered	0.26 pounds
Strength of cyanide solution	0.2 per cent
Percentage on tailings	0.08 per cent

	Gold, dwts.	*Silver, dwts.*
Assay of tailings before treatment, per ton	6.45	30.45
Assay of tailings after treatment, per ton	1.49	16.41
Extraction called for, per ton	4.96	14.04
Recovery, per ton	4.41	14.31
Recovery, per cent	68.3	46.9
Average fineness of bullion	.2243	.7275

	£	s.	d.	s.	d.
Average value of bullion, per ounce	0	19	0	65	1 2.64
Assay value of tailings, per ton	1	7	4	77	2 7.97
Recovered value of tailings, per ton	0	18	9	01	1 2.58

COST OF TREATMENT.

Pounds.	*Cost.* £	s	d.	*Lbs. per ton.*	*Cost per ton.* s.	d
Cyanide 36,495	3,824	10	5	0.97	2	0.53
Zinc 9,720	308	4	5	0.26	0	1.98
Caustic Soda 30,106	245	16	4	0.80	1	1.57
Chemicals	351	14	8	...	0	2.25
Firewood, 387¼ cords	503	8	0	....	0	3.23
Water	456	15	6	....	0	2.93
Miscellaneous stores, etc	203	8	6	....	0	1.30
Laboratory salaries	768	15	2	....	0	4.93
Management	740	0	0	....	0	4.75
Filling and discharging vats	3,096	0	0	....	1	7.87
Other labor	1,044	15	5	....	0	6.71
Royalty	2,861	4	0	....	1	6.36
Bank charges	3,065	1	8	....	1	7.67

Total cost, £17,466 14s 1d.

Total cost per ton, 9s 4 11d.

Mill process employed: Stamping over copper plates and grinding the blanketings in wheelers and berdans.

Professional Cards.

HERBERT LANG,
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

WADE & WADE,
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

D. B. HUNTLEY,
Mining Engineer and Metallurgist,
TELLURIDE, - COLORADO.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Eighteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address, 132 Market St., Room 15, San Francisco, Cal.

H. VAN F. FURMAN,
Mining Engineer and Metallurgist.
SPECIALTY:
SILVER, GOLD AND LEAD.
Room No. 118, Boston Building,
DENVER, COLORADO.

35 NEW MONTGOMERY STREET, SAN FRANCISCO, CAL.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { **Brown's Complete Automatic Mill Process.** **Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces. Etc.**

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

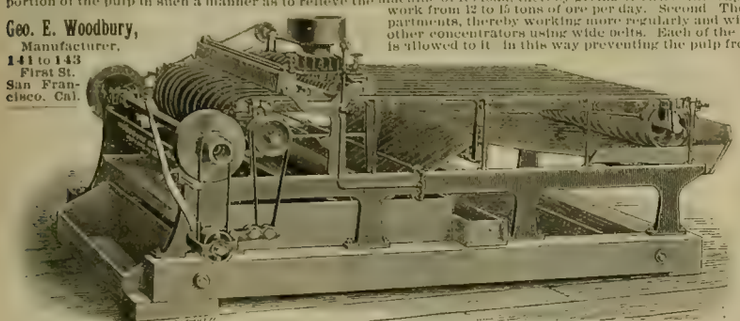
When Writing please mention the MINING AND SCIENTIFIC PRESS.

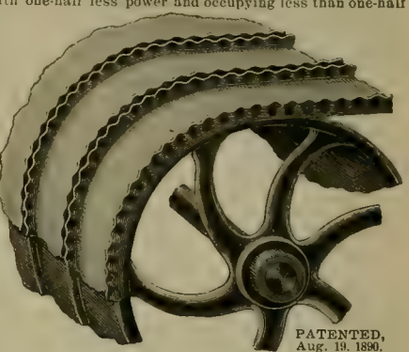
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it. In this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143 First St.
San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

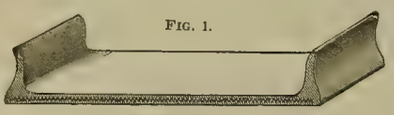


FIG. 1.

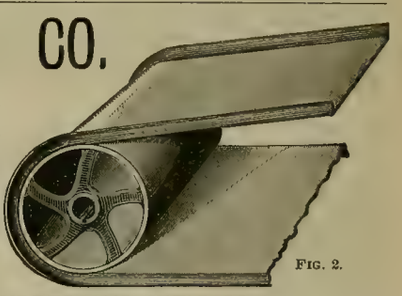

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys or building.

Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.

Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

Coast Industrial Notes.

—The Oregon Improvement Company will build 100 new cars at its shops at Seattle, Wash.

—Trail, B. C., is inaugurating a water system to supply from a 3,000,000-gallon reservoir on Gorge gulch.

—The city government of Mexico wants bids for pumping machinery to be used on the city's sewers. Bids must be in by November 14, '96.

—Lately was struck a third stratum of oil in the Summerland belt in Santa Barbara county, and it is said that a number of new wells will be sunk.

—The Power Development Company in Kern county has let contracts for the construction of four 44-inch wheels at its powerhouse with a capacity of 1500-horse power.

—A shipment of twenty tons of kaolin from the beds near Ashland, Oregon, has lately been made to a pottery firm in Portland. There are extensive deposits, and it is claimed to be of good quality.

—The tie contractors for the Union Pacific are arranging to bring the largest drive of ties down Medicine Bow and Rock rivers ever attempted. The number to be run down Medicine Bow is 260,000 and down Rock river 150,000.

—The first Japanese steamer, the Miike Maru, of the Nipon Yusen Kabuchiki, arrived at Seattle last Monday. The company is under contract to operate a line of steamers for a year to connect with the Great Northern Railroad.

—An explosion at the California Powder Works at Pinole, Contra Costa county, last Tuesday, caused the death of four white men and eight Chinamen. The loss to the company is estimated at $25,000. The company expects to be running again in two weeks.

—The Sierra-Pacific Railroad Company has organized to build a narrow-gauge road from Stockton to Jackson, Amador county. In addition to the main line, it is proposed to build branches to San Andreas, Campo Seco and Plymouth Rock mines in Calaveras county. The main line is to be fifty miles in length and the branches ten miles. The capital stock is $10,000,000, of which $60,000 has been subscribed and $6000 paid up. The directors are B. F. Langford, B. W. Moore, George A. Brown Jr., D. A. Robertson, P. A. Buell and M. J. Gardner, all of San Joaquin county, and W. A. Shippee of Avon, Butte county.

—B. Taylor of Iron county, southwestern Utah, is in Los Angeles perfecting a scheme to build a railroad from Iron county, Utah, to that city. The proposed line would connect with the Union Pacific or Utah Central and Denver and Rio Grande roads at Cedar City. He says it will cross the county to Desert Springs and thence by Bullionville and Pioche, Nev., to Clover Valley, then down the Virgin river to the Colorado river, to Good Springs, to Ivanpah, to Ludlow on the Southern Pacific, through the Morongo Pass to Banning and thence on to Los Angeles. He talks of erecting furnaces at Cedar City and manufacturing rails and iron at that point. The road would cost $10,000,000. A company—the Utah Iron and Coal Company—has been formed in Utah and stock for $5,000,000 will be issued. The money for the road and developing of the iron and coal mines Taylor says he has secured in England. He has a letter from his agent there saying the money has been secured and is ready as soon as the experts have examined the mines and gone over the proposed line.

Recent California Mining Incorporations.

Mariposa Gold Company, S. F.; W. Meyerhofer, G. F. Lyon, E. Ewald, G. W. Allen; capital stock, $100,000; $50,000 subscribed.

Potazuba Mining Company, Sutter Creek, Cal.; T. T. Lane, Angel's Camp; J. Nichols, Jackson; E. S. Barney, Drytown; E. C. Voorhies, Sutter Creek; W. J. McGee, Alameda; capital stock, $100,000; $25 subscribed.

White Cloud gravel mine, Oakland, Cal.; hydraulic mining; capital stock, $100,000; paid in, $20,000; W. B. and D. S. Edwards, O. S. Sherman, J. and A. Mitchell, W. and J. P. Beckwith, J. T. Cole, all of Oakland.

Wonder Mining and Milling Company, Alameda; J. C., H. W. and F. Linderman, J. M. Haskell, J. N. Barstow, all of Alameda.

Obituary.

DR. NOBLE MARTIN of Dutch Flat, Placer county, member of the State Senate from Placer and El Dorado, died last Monday in Berkeley, aged 76 years. Dr. Martin came to California in 1852, engaged for a number of years in mining and then resumed the practice of his profession. His sterling character and virile ability gave him a large influence which has often been used in the Legislature in behalf of mining interests. No man was more universally respected in the mountains among the miners.

Commercial Paragraph.

THE Abner Doble Co. has this week moved into its large new building, corner Howard and Fremont streets. This company is now contracting for electric power and steam railway plants on an extensive scale.

Recently Declared Mining Dividends.

Deadwood-Terra, South Dakota, $100,000, payable Aug. 20th; total to date, $1,240,000.

Swansea, Utah, $4713.75, payable Sept. 15th.

THE commercial micas are: Muscovite (white mica), phlogopite (amber mica) and biotite (black mica). Muscovite is used principally for stove panels. For this purpose it must be clear and free from spots. The best muscovite is ruby red in color when in blocks. The white color comes next in value. The sizes of the sheets most desired for commercial purposes are one and one-half by two inches up to eight by ten inches. Phlogopite is used chiefly for electrical purposes, and is free from wrinkles or crevices. It splits easily and is very flexible, stands a very high temperature without disintegrating; dark spots lessen its value. Waste mica is ground and used as a lubricant for heavy bearings; in certain insulating compounds, for decorating wall papers and as a fertilizer.

Personal.

CURTIS W. LINDLEY has returned from a business visit to Great Britain.

MR. F. EDELSTEN, editor and proprietor of the Los Angeles *Mining Journal*, is in this city on his wedding trip.

A. B. KNIGHT, a mining engineer of Butte, Montana, is here to examine some gold mining properties in the northern part of the State. He is said to represent a moneyed syndicate.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 25, 1896.

566,554.—PLUMB LEVEL—J. Appleton, Modesto, Cal.
566,659.—PLOWS—G. C. Christenson, Newberg, Or.
566,568.—BICYCLE—C. B. Fields, Merced, Cal
566,303.—ROTARY ENGINE—Fisk & Camp, Sedro, Wash.
566,395.—STEAM GENERATOR—A. Heberer, Alameda, Cal.
566,369.—LAST—A. M. Leighton, Everett, Wash.
566,348.—THILL SUPPORT.—E. J. Spencer, San Diego, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GRAIN DRILL ATTACHMENT FOR GANG PLOWS. A. J. Malsbary, Reedley, Cal. No. 553,926. Dated Feb. 4, 1896. This invention relates to an improved seeder attachment for gang plows. It consists of a triangular drill frame having the front end loosely supported upon the plow beam; a swivel wheel supporting one side of the rear of said frame; a loose connection between the other side of the rear end of the frame and the plow frame; shoes or runners traveling upon the ground in front of the grain drill tubes so as to form channels to receive the grain; a transverse bar extending beneath the drill frame; curved springs connecting the front of each runner with the bar; vertical hangers having the lower ends attached to the bar, the upper ends loosely connected with the drill frame; clevices slidably fitted upon the hangers; rocker arms and lever with intermediate connections whereby said clevices are raised or lowered upon the hangers, and chains extending forwardly upon the clevices, having the front end attached to the plow frame so as to impart motion to the grain drill and to regulate the depth of travel of the shoes or runners.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

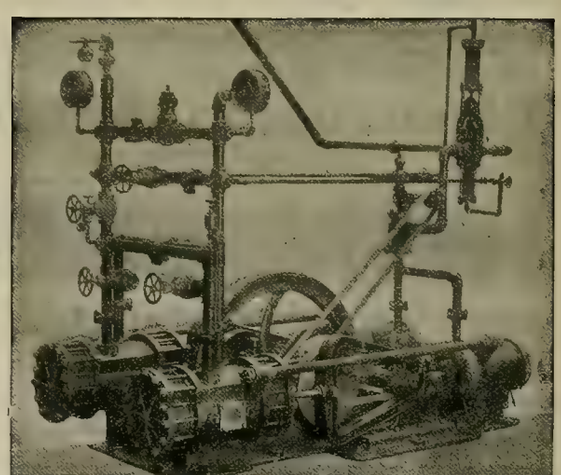
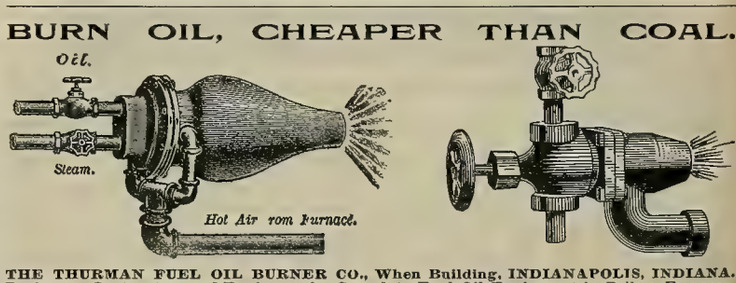
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

BURN OIL, CHEAPER THAN COAL.



THE THURMAN FUEL OIL BURNER CO., When Building, INDIANAPOLIS, INDIANA. Designers, Contractors and Engineers for Complete Fuel Oil Equipment for Boilers, Furnaces, Ovens, Brick Kilns, Forges, Driers, Etc. Acknowledged the Best. Absolutely Smokeless. We Guarantee Our Burners To Be More Economical Than Any Other. Write For Catalogue and Prices.

Books Received.

THE department of geology of the University of California has published a bulletin on the geology of Point Sal in Santa Barbara county, a section that has been of considerable commercial interest on account of the bituminous shales worked there, and the gypsum deposits which in years past was the most important source of that mineral in the State. The work was done by Harold W. Fairbanks and is another valuable contribution on the part of the University to the geology on the coast of California.

Speaking of the extent of the bituminous shale Mr. Fairbanks says: "It has an extensive areal development in the Coast Ranges. The greatest thickness is not known. Professor Lawson estimates it at 2,000 feet at Monterey. It is probably 1,000 feet at Point Sal. There are other areas in Monterey county where it is possibly 2,000 feet, and until the whole region is better known, any conclusion reached at present is liable to need revision."

The bulletin may be purchased from the University librarian, J. C. Rowell, Berkeley, Cal., price 65 cents.

THE introduction of no other new process in mining has ever been accompanied with as much literature on the subject to help it along as the cyanide process, and there should be no excuse for any mining man to plead ignorance of it for want of good, practical data. The revival of mining has, of course, done much to give the process encouragement, and the result has been its rapid and wide adoption wherever the ores are adapted to such treatment. James Park, director of the Thames School of Mines in New Zealand, has lately published a second edition of his book, "The Cyanide Process of Gold Extraction," a comprehensive, handbook that will be of value to those interested in the subject. Its publication is timely, for there have been of late many improvements in the minor details of the process and in the appliances used. Mr. Park has made use of data from leading plants all over the mining world. Published by Champtaloup & Cooper, Auckland, N. Z., and George Robertson & Co., Melbourne.

Power From Small Mountain Streams.

There is a growing tendency among the miners and exploiters of mines in the western part of the United States to utilize as motive power streams which not so very long ago would have been considered unworthy of consideration as sources of power. Men are beginning to learn that head counts as well as volume, and that a tiny stream with several hundred feet head may be as valuable a source of power as the more imposing fall of much lower head. Then, too, the little stream needs no expensive dam or head works to confine it, but can be trapped and guided at comparatively small expense, and instead of being allowed to fall freely, it can be led into a pipe which impounds it all, and thus it can be confined and led perhaps 500 to 1000 feet down the mountain, accumulating pressure as it descends until it shoots out with full force against the buckets of the Pelton wheel, or quietly exerts its statical pressure in the chambers of a direct air compressor.

Not so very long ago the writer saw a plant being installed over 8000 feet up the Rocky mountains, and the primitive pipe-making establishment was very interesting. Rather than incur the expense of hauling the wrought pipe, a small pair of bending rolls had been procured, and these, with a portable forge, constituted the equipment. Under a frame shed by the mountain side three men were turning out length after length of riveted sheet-iron pipe, right at the place where it was to be used, and the pipe line was being constructed 500 feet up the canyon, bringing down over 200 horse power to the spot where it was to be utilized. The operations seemed somewhat primitive at first sight, but the expense account of the establishment was a minimum, and when the cost of burro train and the railway freight, and the profits of several middlemen were taken into account, the miners were probably ahead in the long run.—From Cassier's Magazine for September.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo

An experienced and practical mining engineer will be open to engagement in a few weeks; best of references, including present employers. At present am superintendent of a mine; am a mechanic, surveyor and assayer. Address, "Superintendent," care of Mining and Scientific Press.

An Ex-Supt. and Mining Engineer,

Lately returned to California, desires a situation. Best of references. Address No. 37, this office.

Mining Engineer and Metallurgist,

Graduate of Lehigh University '95, desires a position with reliable mining company, United States or Canada preferred, but will go to Mexico.

Address LEHIGH,
Care Mining and Scientific Press.

DENVER, COLORADO.

MERCUR.
UTAH'S NEW EL DORADO.
Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1890 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

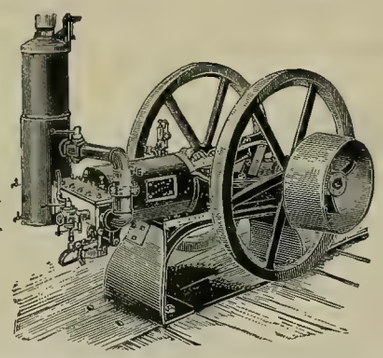
CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING



THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c.	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c.	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c.	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c.	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

PAYNE'S

PATENTED

GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

HENDY - NORBOM ORE CONCENTRATOR.

Office of ORLEANS MINING COMPANY, GRASS VALLEY, CAL., Dec. 12, 1895.

Mr. John O. Norbom, San Francisco, Cal.—DEAR SIR: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3½ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen, which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly, [SIGNED] C. A. BROCKINGTON, Superintendent.

Office of FEDERAL LOAN MINING COMPANY, NEVADA CITY, CAL., Dec. 10, 1895.

Mr. John O. Norbom, San Francisco, Cal.—DEAR SIR: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly, [SIGNED] J. VINCENT, Superintendent.

WHY THE SPRINGER CONCENTRATOR IS THE BEST.

It will do more and cleaner work than any Rubber belt machine.
It weighs only one-half as much as some of the other six-foot Concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any.
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer Concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other Concentrators.

SAN FRANCISCO, May 27, 1896.

I. S. Van Winkle & Co., 413 Market St.

DEAR SIRS:—In a letter just received from our Superintendent, Mr. Trowbridge, he says, referring to your Concentrator: "The new Springer Concentrator is fulfilling every expectation. A few minor points may be improved upon, but in its main features it is almost perfect. I shall write more fully after further work."

Yours very truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

Extract from Letter of W. S. Trowbridge, Superintendent Bald Eagle Mining Co. June 20, 1896.

"We work twenty tons of ore per day and size out all coarse portion after it has been worked over two other machines, and run all the slimes and finer portions over your machine. I think it would easily handle twice the quantity. It is certainly doing splendid work now, in a difficult place. I believe the belt will wear indefinitely."

July 12, 1896.

Ship us by steamer another six-foot Canvas Belt Springer Ore Concentrator and have the new Rubber Flange attachment, and put a rawhide belt on wheel. Yours truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 3, 1896.

Merchandise brokers state that there is a good demand, better than at this time in 1895, for about all lines except chemicals and leather. For groceries the consumption call is exceptionally good, which substantiates assertions made that there has been quite an influx of people, particularly in the mining regions. Iron workers and machinery manufacturers state that orders hold up remarkably well, and notwithstanding the presidential election there is quite a number of orders seeking to be placed. Under close competition here and with the East, bids have to be made low down.

There continues to be a good inquiry for gold mining properties. Several mining experts from other States have been here in the interest of buyers. One or two of them do not look so much at the price asked as to the mine. If the property is deemed to be worth several hundred thousand dollars they would not hesitate in securing it or else getting a bond for a reasonable length of time so as to report. This is encouraging and gives color to the opinion that the gold mining industry in California will continue to forge ahead for some time to come.

The local money while working close is not so close as three weeks ago when there were such heavy withdrawals of gold from banks for hoarding. It is estimated that several million dollars were withdrawn which compelled the banks to import gold from the East. Now they have a large supply and are in position to meet any and all demands. Several corporations that employ a large number of hands pay in standard silver which is quite a convenience, for at times it is hard to get silver dollars in exchange for gold. Merchants say that remittances from the retail trade is good —much better than at this time last year. These payments put the mercantile community in good financial position. It is said that outstanding accounts have been reduced to small amounts, considerably less than usually obtains at this season of the year. At the East the money markets continue to show a gradual, growing ease. The heavy imports of gold from Europe have had a favorable influence. Considerable foreign money is seeking a market at New York for 60 and 90 days' paper.

New York Silver Prices.

NEW YORK, Sept. 3.—Following are the closing prices for the week:

	—Silver in— London.	N. Y.
Friday	30⅝	66¼
Saturday	30⅝	66¼
Monday	30 11-16	66⅜
Tuesday	30 11-16	66⅜
Wednesday	30 11-16	66⅜
Thursday	30⅝	66¼

	Copper.	Lead.	Iron.	Tin.
Friday	10 62½	2 65	10 25@12 50	13 30
Saturday	10 65	2 65	10 25@12 50	13 30
Monday	10 65	2 70	10 15@12 50	13 25
Tuesday	10 65	2 70	10 15@12 50	13 25
Wednesday	10 65	2 70	10 15@12 50	13 25

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	Par
New York Telegraphic Transfer	Par
London Bankers' 60 days	$486
London Merchants	$4.85
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	66¼
Mexican Dollars	51½@52½c

Eastern exchanges are nominal.

SILVER.—The market has ruled dull at easy prices throughout the week. There is a very light inquiry here either for export or speculative purposes. The Eastern markets are reported quiet. It is stated that very large quantities of bullion have been sold chiefly for export by holders in want of ready money. These sales account for the low prices abroad. With the selling pressure relaxed, the markets ought to do better on a legitimate demand.

MEXICAN DOLLARS.—There is a very light call and as the supply is liberal the price has receded. The market closes weak at the lower quotations.

COPPER.—In our market the trading is confined largely to jobbing lots. The East reports dull markets, with buyers favored by sellers. The home demand is still light, with no improvement looked for until well into October. The demand for export is well sustained. European advices are confirmatory of a liberal demand from manufacturers and shipbuilders. This call steadily decreases the stock in hand, both in England and on the Continent.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is essentially unchanged.

Domestic trade, per flask	36 50

For export quotations are nominal, but less than for home.

LEAD.—The market is still lower for pigs both at the East and abroad. The stock in this country and Europe is exceptionally heavy while the production is not decreasing.

Our market is quoted as follows:

Pig	—	@	3 60
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—There is a slightly better jobbing demand.

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do.	"	"	1 45

TIN.—The call for pig on this coast is light. At the East there has been a slightly freer movement which has strengthened prices for pig.

The market is quoted as follows in jobbing lots:

Pig, per lb	14
Plate, I C coke, heavy, per box	$4 10@ —
" " " light, "	4 00@ —

ANTIMONY.—The demand is fair, with the market steady at 7¾@8⅛c in a jobbing way. New York mail advices quote 7⅜@7½c for Cookson's, 6⅝c for Hallett's and 6½c for Japanese, from store.

BORAX.—There is a continued free shipping movement.

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	5¼
Concentrated, "	5⅝

POWDER.—The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—Brokers state that the consumption is exceptionally good for the season. The East reports the markets somewhat unsettled, with some cutting being done. The consumption is increasing.

Our market is quoted as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50

Bolt	¾ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

COAL.—Imports for the eight months ending with August aggregate 820,200 tons in 1896 and 868,500 tons in 1895. The market for Australian, shipment and on the way, is lower; but English is higher, owing to an advance in freights to load.

SPOT FROM YARD—PER TON.

Wellington	$7 50	@	8 00
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00
Gilman	5 50	@	6 00
Seattle	5 00	@	5 50
Coos Bay	— —	@	4 50
Cannel	— —	@	8 50
Egg, hard	— —	@	11 50
Wallsend	— —	@	7 00
Scotch Splint	— —	@	7 50
Brymbo	— —	@	7 50

TO ARRIVE—CARGO LOTS.

Australian	5 50		
Liverpool Steam	6 25		
Scotch Splint	— —		
Cardiff	6 25		
Lehigh Lump	9 00		
Cumberland	13 00		
Egg, hard	10 00		
West Hartley	6 50		

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—The demand is fair for home and good for export.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is barely steady.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Sept. 3, 1896.

The market has exhibited more strength with quite an advance in the Gold Hill shares under the lead of Confidence and Challenge. What caused the upmove seems to be a mystery, but as usual, the street is busy circulating all kinds of reports as to why they advanced. The most plausible are: More men to be put to work for election purposes, more favorable formation in the west cross drift and the other to collect assessments knowing that the public pays them when the market advances. Those in position to be informed have no faith in the upmove of the Gold Hill shares. They state that very little ore will be shown up this year but quite a number of assessments will show up. They also say that more men put to work more money will be required to meet expenses. If their views are correct then holders of the shares will have only themselves to blame for not selling at an advance when given an opportunity. These remarks are as applicable to shares in the other groups as to the Gold Hill. The public is given too much to rainbow chasing when dealing in shares and, like boys who try to get to the end of the rainbow for a pot of gold, they get experience, but the manipulators get out with the coin. The market acts as if it will go to higher figures, yet dealers must get the idea that it will run away for whatever is coming in the near future is purely and simple a deal based on a little ore and a good deal of talk, yet the public will be given an opportunity to get out at the advance, but 16 to 1 the large majority will buy and not sell.

Two assessments were levied the past week. Report has it that the Ophir and Challenge companies will levy assessments soon, which will be followed by others. Even Con. Virginia is expected to come in for one within the next six weeks.

The market for shares of the Bodie mines held fairly steady up to Wednesday, when Bodie sold for more money. The advance is due to encouraging news from the mines.

From the Comstock mines the news is of an unimportant character; everything seems to point to time. In Alta they are still sinking a winze in the Keystone ledge, without any change reported. Overman is raising a few tons of ore, but no mention is made of having found rich ore. Seg. Belcher and Belcher are raising ore, the former a little over 20 tons and the latter a little over 60 tons. The ore is of fair grade. In Crown Point no work is reported, but the official letter states that the last of the low-grade gold has been shipped to the mill. Since the letter was sent off it is said that more men have been put to work. About 179 tons of ore has been milled by Belcher, but the battery assay is not given. There is nothing new from Yellow Jacket. Late advices from Confidence are essentially unchanged. They are raising a few tons of fair grade ore. They fail to state the nature of the work going on in that mine, and also in Challenge. Reports received from Virginia City are to the effect that more men are to be put to work on the Gold Hill mines. It is also stated that the joint Confidence, Challenge and Con. Imperial crossdrift is changing for the better. In Con. Imperial both crossdrift No. 3 and the Challenge, Confidence and Con. Imperial crossdrift are being pushed slowly ahead. In Alpha they continue to fool around the 500-foot level. Work is still being done in the long west crossdrift in Bullion. In Potosi they are working in the 450-level without any particular change reported. Advices from Chollar continue to report the raising of ore while prosecuting exploiting work. From Hale & Norcross nothing new comes to hand. The work continues of an exploiting character. Official letters from Savage are aggravatingly long, but without information of an encouraging character. From Gould & Curry and Best & Belcher our advices continue to report work to the east from the Bonner shaft. The last letter from Con. Virginia indicates that the ore on the 1750-foot level will give out before long. They are milling that already taken out. Public interest centers on the work under way to the east from the 1650-foot level, which will soon be in interesting ground. On the 1000-foot level work is still being done towards the west. Some seepage of water is coming in, which is more favorable. The work in Ophir, Mexican, Union, Sierra Nevada, Utah and Andes is on the same levels heretofore reported, with no material change in the formation.

From the Brunswick lode our advices continue to note active work by the different companies, with no feature of special interest to note. In Occidental work is continued on the levels heretofore reported. They are still sinking from the 750-foot level. The mill was to have started up this week. In Chollar they are drifting south on the 300-foot level, but work in the chute has been temporarily stopped. They are also drifting south on the 200-foot level. In Hale & Norcross the 400-foot level station is completed, and drifting south will be commenced as soon as possible, probably by the 10th or the 15th of the month. When started, the work will be pushed with the utmost speed. In Savage they have taken up the north drift on the Hale & Norcross 300-foot level.

The Con. Virginia, Best & Belcher and Gould & Curry shaft No. 2 is being sunk slowly. In Gould & Curry quite active work is being done, with no change to report since last week's review.

From the Bodie district the news grows in interest. These mines appear to be a vein on business principles, and therefore it is quite refreshing to read the superintendents' letters. Some narrow streaks of high-grade ore are being encountered in Bulwer, Bodie and Standard. It looks as if the mines will soon begin to pay more than expenses. Some Standard and Bodie ore has been milled.

The following illustrates the changes of the week:

Mines.	Aug. 27.	Sept. 3.
Alpha	....	17
Alta Consolidated	10	12
Andes	31	31

SOME TIME AGO a queer story came from one of the English coal mining districts, where some of the mines had been drowned for years, and the many attempts to pump them dry had been ineffectual. After many thousand pounds had been spent in pumping without doing any good, it was found that the water raised by the pumps had been allowed to find its way back into the mines through old shafts, crevices and other avenues. It made both amusing and instructive reading, but if one simply changed the names, the whole account sounded not much different from one hundred and one things within the experience of undoubtedly a great many engineers. Work is performed over and over again to no purpose, just because care is not taken to see that every stroke tells.—From Cassier's Magazine for September.

Assessment Notices.

BELCHER SILVER MINING COMPANY. Location of principal place of business San Francisco, California, location of works, Gold Hill, Storey County, Nevada

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of August, 1896, an assessment (No. 35) of twenty-five cents ($25) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room No. 37, third floor, Mills Building, N. E corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1896 will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY the 30th day of September, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. PERKINS, Secretary.

Office—Room 37, third floor, Mills Building, N. E corner Bush and Montgomery streets, San Francisco California.

JAMISON MINING COMPANY. Location of principal place of business San Francisco, California. Location of works, on Little Jamison Creek, near Johnsville Plumas County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of July, 1896, an assessment (No. 8) of five cents ($5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 320 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1896, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 31st day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SAM W. CHEYNEY, Secretary.

Office—Room 50, 120 Sutter street, San Francisco, California.

POSTPONEMENT.

At a meeting of the Board of Directors o the Jamison Mining Company, held on the 22nd day of July, 1896, it was resolved that any stock upon which the assessment shall remain unpaid on the seventh day of September, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, September 28th, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

ANCHOR COAL AND DEVELOPMENT COMPANY. Location of principal place of business, San Francisco, California; location of works, Kelso, Cowlitz county, Washington.

Notice is hereby given that at a meeting of the Board of Directors held on the 24th day of August, 1896, an assessment (No. 7) of Three Cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market Street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the twenty-fourth (24th) day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office—No. 632 Market Street, Room 5, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of September, 1896, an assessment (No. 79) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth (5th) day of October, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of October, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 2d day of September, 1896, an assessment (No. 24) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of October, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 29th day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. H. Leek, in the Miocene mine, near Crescent Mills, Plumas Co., to deposit tailings in Rush creek; from Hugh Craig, in the Wasajo mine, near West Point, Calaveras Co., to deposit tailings in the middle fork of the Mokelumne River; and from John Faubel, in the Mad Mule mine, near Stella, Shasta Co., to deposit tailings on the bank of Whisky creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 21, 1896, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. A. Keefer, in the Aleyone Mine, near San Andreas, Calaveras Co., to deposit tailings in San Domingo Creek, and from J. R. Sears, in the French Claim, near Indian Diggings, El Dorado Co., to deposit tailings on the bank of Clear Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 14, 1896, at 1:30 P. M.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, J. E. HAMILTON, P. O. Box 66, Placerville, Cal.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the Thirteenth (13th) day of July, 1896, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
E. C. Cain	170	2,500	50 00
E. C. Cain	171	2,500	50 00
C. L. Dingley, Jr.	72	800	16 00
C. L. Dingley, Jr	73	800	16 00

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

220 Market Street ..... **San Francisco, Cal.**

Assaying.—Part I—Gold and Silver Ores.

Third edition: Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid..... $1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid..... $1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth..... $3 00

Prospector's Field Book and Guide.

By H. S. Osborn..... $1 50

A Practical Guide for Prospectors and Miners.

By C. W. Moore. With numerous illustrations..... $4 75

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid..... $6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid..... $3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid..... $3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth..... $5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated..... $5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated..... $5 00

Losses in Gold Amalgamation.

By W. McDermott and P. W. Duffield..... $2 00

Electricity in Mining.

By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid..... $5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated..... $4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.

By T. E. Van Wagenan..... $1 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth..... $4 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth..... $3 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth..... $2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn..... $4 50

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth..... $1 50

Practical Metallurgy and Assaying.

By A. H. Hiorns..... $1 50

The Practical Metal Worker's Assistant.

By Oliver Byrne. Illustrated..... $5 00

Quartz Operator's Handbook.

By P. M. Randall..... $2 00

Assayer's Guide.

By Oscar M. Lieber..... $1 50

Assayer's Manual.

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated..... $3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid..... $2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather..... $5 00

Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo..... $7 00

Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth..... $7 50

Manual of Determinative Mineralogy.

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth... $3 50

RISDON IRON WORKS.

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly.

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly,

JOHN BECK. Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly.

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year.

CHAS. C. McIVER, President.

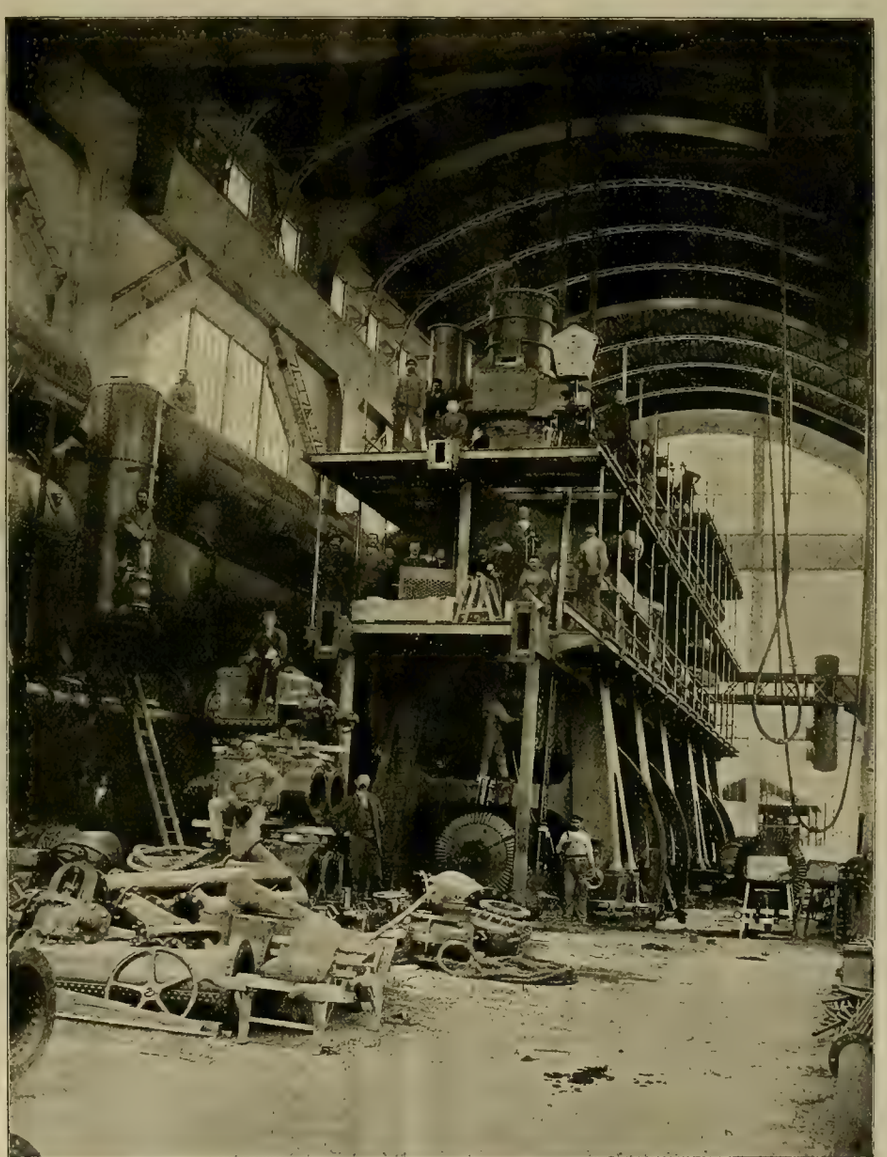
Air Compressing on a Large Scale.

The engraving on this page shows graphically what is being done in air compressing plants on a large scale. The cut which appears here for the first time in this country is of a Riedler compressor plant, Quai De Gare, Paris, France, where four with triple expansion engines of two thousand horse-power each, are used for a system of pneumatic power distribution, and have, according to official tests, proved economical, requiring 60 per cent less fuel than the other compressors in the Paris Central station, owned by the same parties and working under similar conditions, the total cost of work being reduced at the rate of 1 to 2½ as compared with the ordinary system of compressors formerly used at the Paris Central plant.



RIEDLER COMPRESSOR PLANT, QUAI DE GARE, PARIS, FRANCE.

In this type of compressor the valves are allowed to open freely by the action of the air, while the closing is done by positive valve gear. The valve chamber, as a rule, contains only one suction and one discharge valve. The valve spindle, passing through the the chamber closes the valves at the moment when the stroke of the piston changes. Near the end of the stroke a very small lift is allowed to the valve, which can be regulated at will, thus affording a relief for the valve under high speeds and variable pressures.

In high speed compressors springs are inserted either in the closing gear or on the valves, so that by compression of the springs the action of the valves is modified to meet increased resistance and variable conditions of working. The ordinary resistance the valves meet is so slight that it will not compress the springs. The movement to operate the gear may be taken from any part of the motor; for instance, from a wrist plate, as in the case of a Corliss engine. All that is required is that the valve shall receive a rocking motion similar to the reciprocating motion of a slide valve. Large compressor valves are provided with cushions which allow them to open freely, but which prevent them from opening beyond a desirable limit. This ensures the valves remaining fully open during suction or discharge until they are closed by the action of the valve gear described. The valve motion can be derived from the same eccentric which operates the steam valve, either directly or through a wrist plate. The arrangement of the gear in special cases may be widely modified, but it always accomplishes the same purpose, controlling the suction and discharge valves mechanically.

The compressor proper, as here described, can be made of any style that may be deemed advisable, either simple or compound, or even triple, cylinder. In most cases the air is not used at so high a pressure as to require compression in three stages.

The horizontal style of compressor, driven by compound condensing Corliss engines and with compound air cylinders, will generally be found the most economical and convenient, although the vertical style of engine has some advantages over the horizontal, notably in space, and because the weight of the piston does not cause the cylinder to wear oval.

These compressors are built by Fraser & Chalmers, London and Chicago.

In speaking of the advantage of employing local engineers, in the London *Mining Journal*, Thomas Tonge says: "British capitalists would do well to utilize to a much greater extent Colorado mining engineers and experts, and, judging by past experience, would save large sums of money by so doing, not merely in traveling expenses from England but in the better and more reliable advice they would get. There are in Colorado considerably over a dozen mining engineers and experts, both British and American, of many years local experience and unblemished reputation, who must of necessity be more competent to pass opinions on the merits of a mining property in Colorado than any man sent from England to Colorado, possibly for the first time, and at best only an occasional and transient visitor." An evidence that the British syndicates appreciate the advantage of local experts for making examinations of mines for them is the fact that they are calling upon the leading California engineers for such work almost exclusively in California. The splendid reputations made by engineers from this State all over the world has done much to inspire the British with a confidence not only in the ability, but in the integrity of our leading men in that profession, and to-day the whole mining world looks to California more than anywhere else, not only for its miners, but for the newest and best methods in mining in many respects. It is for this reason, too, that the MINING AND SCIENTIFIC PRESS has a larger circulation than any other mining journal published in America and circulates more widely than any other mining journal in the world.

THE steady growth of the mining industry in Mexico since the present mining law came into force in 1892 is shown by the number of titles to mines issued in each fiscal year since then as follows: 1892-93, 417 titles, covering 2660 hectares; fiscal year 1883-94, 961 titles, covering 5830 hectares; fiscal year 1894-95, 1044 titles, covering 7860 hectares; fiscal year 1895-96, 1924 titles, covering 15,451 hectares; total, 4346 titles, covering 31,803 hectares.

THE business at the United States land offices in the West is larger than it has been for years, due largely to the increased activity in mining. While a large proportion of the filings are for agricultural lands, they are the direct result of mining activity.

EDITORIAL.—Air Compressing on a Large Scale; The Advantage of Employing Local Engineers; Growth of the Mining Industry in Mexico; Increase of Business in the Land Offices of the West, 213. A New Feature of the Geological Survey; The Miners' Association; Shifting of Old Lines in Mining; Dividends in California Mining Corporations; Dividends of the Pioneer, S. A., Mine, 214.

A New Feature of the Geological Survey.

To find the landmarks of the township and section corners of our public land surveys has always been the burden of the county surveyor's life, even in carefully surveyed and carefully marked districts. But the pernicious system of public land surveys by contract has led to such abominable work that the finding of these landmarks is often an entire impossibility, even when they are correctly surveyed. Throughout large districts, especially in the arid regions, corners, when marked at all, were indicated by some such makeshift as a cottonwood stake or a loose stone, which are now often misplaced or destroyed.

The following telegram shows a disposition on the part of the Geological Survey to aid matters a great deal by the re-establishment of permanent Township corners over areas covered in the process of topographic mapping:

CHEYENNE, Wyo., Sept. 1.—The United States Geological Survey is commencing a most important work in this State. It consists in placing iron monuments at each township corner with bench marks. The work which will be commenced first is in Laramie county where over 3000 sqare miles of country will be thus marked. The posts are iron tubing 3½ inches in diameter and 4 feet long. They are swelled out with a flange at the bottom and will be sunk 3 feet in the ground with one foot extending above the surface. On the top is fastened a brass plate on which is stamped "United States Geological Survey" and "B. M." The elevation, township and range numbers will be stamped on the plate by dies carried by the engineers. The posts will be painted with abestos paint and will be practically indestructible. In the future all Government surveys will be marked in this manner in the West. The system will be of immense benefit to settlers and ranchmen in this State, the system used prior to the present time to mark Government surveys having been of little service.

This additional feature to the methods of the survey is due to an agitation started by Mr. Ellwood Meade, State Engineer of Wyoming. But the remarking of township corners was not the principal object Mr. Meade and his supporters had in view. On the contour maps of the interior plains there are too few distinctive topographic features to give the traveler any definite method of determining his location, even approximately, upon the map. In a country as rough as the Sierra Nevadas there is always some prominent hill, stream or cross-roads or some other feature indicated upon the map by which to locate himself. But in the expanseless plains the rolling hills have such a confusing sameness, with no distinctive points within the horizon, that topographic maps are well nigh useless. By the establishment of permanent, well-marked stations indicated upon the maps some definite means of location is offered. Another advantage in the re-establishment of the township corners and their indication upon the maps is that it makes it possible to tie the land surveys on to the Geological Survey maps—an impossibility hitherto. And again by indicating the elevation upon each of these corners, is furnished invaluable data for datum points in engineering work requiring greater accuracy.

The location of these corners offers a valuable check upon the work of the survey. Heretofore the details of a hill and canyon might be well enough delineated upon the map for a person standing upon the hilltop to realize which hill he stood upon, but, without a resurvey, he could not know whether the distance to the next hilltop was correctly indicated. Those whose duty it has been to resurvey some of the work of the Geological Survey too well know the frequency of such errors.

But, by all means, the most important and invaluable feature of the working of definite points upon the ground, and their indication upon the maps, is the reactionary effect upon the employees of the survey. The last error mentioned, and many others altogether too frequent in the work done from 1882-1888, were due to sketching great areas from some prominent hilltop. In substance, the new method guarantees that the employees must conscientiously traverse the ground. The premium placed upon cheap work by past principals of the survey has resulted in a vast waste of public money and any additional check on accuracy cannot but be cheaper in the end. The remarking or at least the indicating of township corners may for these reasons be well applied to other regions than Wyoming.

To Mr. Meade is due the credit for the suggestion and adoption of the idea. But the Geological Survey under Director Walcott has shown itself willing and anxious to meet the public demands and to him is due the credit for the policy of practical results exhibited in so many directions.

ONE of the mines of the Rand, the Pioneer, has declared in dividends this year up to the first of August, a total of 200 per cent upon the capital. To record this is refreshing in view of so many cases of overcapitalization. There is not a mail that does not bring to us exchanges, published in the interest of miners, which protest against this overcapitalization, and warn their readers against countenancing it. Papers from Australia, from New Zealand, from British Columbia, from Oregon, and from all over California, continually speak of evils done by promoters who have taken under bond good mines that would pay a reasonable profit upon a fair investment and had them placed upon distant markets at far more than their real value. In most of these cases the vendor—"the honest miner"—receives but a fair price for his property, the balance going to the harpies.

THE public seldom hears of any dividends paid on shares in California mining corporations; this is not an indication that such dividends are not paid. There are a number of large mines in California that pay dividends that would be interesting to the public at large on account of their magnitude, but these mines are controlled as close corporations and worked by the individuals who own them as purely business enterprises. Mining in California is generally conducted upon these lines. The average Californian is much more interested in making money legitimately out of mining as a business than through the stock jobbing methods that were so much in vogue a few years ago. It is probably for this reason, as much as anything else, that foreign capitalists are so much inclined to seek for investments here.

THERE has been of late a shifting of old lines in mining. Extensive gravel mines are being opened up in Idaho, Wyoming and Colorado; copper deposits that promise to develop into big mines have lately been discovered in northern California and southern Oregon, while in Nevada there have come many reports of opening up of free gold quartz mines. Miners are learning to expect more than one kind of ore in a district. Much more is known of the occurrence of minerals and as a result more intelligent work is being done by prospectors.

The Miners' Association.

In connection with the coming annual meeting of the California Miners' Association, in November, we have received from the Secretary, Julian Sonntag, some facts as to what the organization has accomplished and as to its needs. It is worth the attention of miners and we present his statement, as follows:

Within the past three months the question has often been asked me, as secretary of the California Miners' Association, "What are you going to do at the annual meeting of the Association, to be held in this city in November next, and what have you done during this year?" Through your paper I wish to offer some suggestions and facts.

The California Miners' Association is no longer an experiment, but a permanent organization. Through the medium of this organization, a greater interest has been taken in mining in California; it has brought to the attention of the European, as well as the Eastern public, the fact that to-day California is but in its infancy in mining.

It has brought to the attention of Congress the fact that the miner has some rights which must be recognized. It has through its influence caused the Caminetti act to be passed, has obtained an appropriation from Congress of $250,000 for the erection of dams and came within an ace of passing the Mineral Land Bill. To-day, through its work, 132 hydraulic mines have been granted permits to operate and the great injustice that has been done the hydraulic miners has been partially righted. It has urged upon the Secretary of the Interior to withhold all patents to the Southern Pacific Railway Company until the standing as to their indebtedness to the United States Government has been fully determined. It is now being done—at least it was done during the last month of Hoke Smith's incumbency of the office of Secretary of the Interior—and before the 54th Congress convenes we hope to have the Mineral Land Bill passed and save the few remaining acres to be patented as mineral land.

This coming year the miners of America want a Secretary of Mines and Mining, and the miners of America do not merely want a politician, but a man who will prove a credit to the nation, to his calling and to himself. And the California Miners' Association wants to take the first steps toward such a movement, thereby securing a right to which they are justly entitled.

The worth of the California Miners' Association is not yet fully appreciated by the miners themselves. This is shown by the fact that last year nine of the leading mining counties have collectively paid into the treasury less than $50, and had it not been for Nevada, Placer, Trinity, Sierra, Yuba and San Francisco, which counties paid in over $5000 between October 1st, 1895, and September 1st, 1896, we would have been unable to maintain a representative in Washington during the last session of Congress, whose expenses alone amounted to $3211.55. The balance was principally used for paying the indebtedness of the association contracted during 1895. Not one dollar went towards paying any traveling expenses or salaries of the association's officers. What a contrast this is to the Anti-Debris Association, whose annual expenses for rent, secretary, agents, spies, attorneys, etc., amount annually to $10,000—and the poor, deluded farmer is the loser. Why they have not yet had their eyes opened is a mystery.

The California Miners' Association has been fortunate in having within its fold a few men of the legal profession, who at all times have been ready and willing to render assistance upon questions as to mining law, its interpretation and decisions. I now particularly refer to Messrs. Wright, Ford and Ricketts.

The secretary should have an office especially for business of the California Miners' Association, where he can be found at certain hours of the day, and an assistant who shall be at the office from 9 A. M. until 4 P. M. daily to answer all questions appertaining to the business of the office; should make it the headquarters of members where they can meet, discuss, write or read, as their business or pleasure may dictate; where all important papers, books or pamphlets appertaining to mining should be kept on file; and where the Executive Committee should hold their monthly meetings.

In conclusion, I deem that at all times the president of the Association should be a miner, whose principal occupation is that of mining, and that he be a conservative and impartial man. It is with the deepest regret that I am authoritatively informed of the retirement in November next of our worthy president, Hon. Jacob H. Neff, who has served the Association since its beginning in the capacity of its chief executive officer, in a manner that has proven him to be a peer amongst men and has endeared him to the miners of California by his honest and faithful efforts, and it behooves the delegates to be appointed by different county organizations to the annual convention to be careful to select a man to this position who will prove a worthy successor.

Concentrates.

THERE are thirteen boats plying on the Yukon.

THE August profit of the Simmer & Jack, South Africa mine was $95,000.

THERE is a general resumption of work in the Rhodesia, South Africa mines.

OF the world's output of coal last year, the United States produced 30 per cent.

A NUMBER of Leadville miners have gone to Butte, Montana, looking for employment.

THE Fifth National Irrigation Congress will be held in Phœnix, Arizona, Dec. 15, 16 and 17.

THE French Creek Mining Company near Ætna, Siskiyou county, is to enlarge its mill to ten stamps.

THERE was picked up a 47-ounce gold nugget lately, valued at $765, near Hawkinsville, Siskiyou county.

THE owners of the Reward mine at Pine Grove, Amador county contemplate erecting ten additional stamps.

THE Red Jacket shaft in the Calumet & Hecla copper mine, which was started in 1880, is down to a depth of 4900 feet.

A 30-STAMP mill with concentrators and a general reduction works are to be built near the Clifton tunnel near Austin, Nevada.

IN the Pierce City mining district, Idaho, a booming process for working the gravels is in use and a number of reservoirs are being built.

AT Randsburg, Kern county, they are staking out town lots and a new stage line with six-horse coaches from the railroad is contemplated.

THE Bi-metallic drain tunnel to tap the Bi-metallic mine, near Philipsburg, Montana, was completed last week and is 8200 feet in length.

ON Williams creek, in Cariboo, the Cariboo Gold Fields Co. are, it said, going to spend a million dollars in development work on that stream.

A COMPANY has been organized at Great Falls, Montana, to work the auriferous gravel in the Missouri river, near Townsend, with dredgers.

IT is said to be the intention of the Anaconda Company of Montana to continue sinking one of their shafts now down 1400 feet to a depth of 4000.

THE '95 gold output of New South Wales was 360,016 ounces, the largest annual yield since 1873, when the aggregate in that country was 361,784 ounces.

NEGOTIATIONS are pending for the purchase of the War Eagle mine in British Columbia which has been bonded to D. C. Corbin. The price is said to be $1,000,000.

PREPARATIONS are being made to open up the Cherokee Flat mine in Butte county as a drift mine, the litigation which has tied it up for many years having come to an end.

W. H. STORMS, Charles G. Yale, H. S. Durden, W. A. Hall and R. S. Clark have organized the Junction Mining Company to work property near Soulsbyville, Tuolumne county.

THE Shellberger placer mine at Osceola, Nevada, recently cleaned up $12,000 from twenty-four days' work. There is much rich gravel in that vicinity, but very little water.

THE Providence Mining Company have decided not to rebuild their recently destroyed chlorination works. Satisfactory arrangements have been made by which they will be able to dispose of their sulphurets.

THE New Denver, B. C., *Ledge* says that, owing to the unsatisfactory condition of the price of silver, it is probable that some of the larger properties in the Slocan will close down until after the election in the States.

THE Olive Mining Company, organized at Spokane with a capital of $20,000,000 to work the Volcanic mine on Kettle river, B. C., claim that they have an ore body, carrying gold, silver and copper, 600 feet wide and 3000 feet long.

THERE were reported by the British Columbia *Gazette* of Aug. 20th six new mining incorporations—two with a capital stock of $1,000,000 each, two of $750,000, one of $500,000 and one of $75,000. The shares in each case are placed at $1 each.

THE Trail Mining Company, in the Kootenay district, B. C., in running a lower tunnel 8 feet wide have two power drills, side by side, in the face; fire the blasts by electricity, putting off fourteen shots at a time, and are making 8 feet per day.

THE Consolidated Asphalt Company has subleased the right to mine for asphalt upon the Guadalupe rancho, in Santa Barbara county, for a term of years, from William Horswick, the original lessee from Rene de Tocqueville, the owner, for $100,000.

DR. V. T. MCGILLICUDDY, dean of the School of Mines of South Dakota and F. C. Smith, Professor of Geology and Metallurgy, have gone to Portland, in that State, to begin a geological and topographical survey of the Bald mountain and Ruby Basin district.

A. H. EDDY, of Hartford, Wash., has returned from Alaska, where he reports having discovered two petroleum wells in the mountains, not far back from the coast and within 100 miles of Juneau. He claims that there is a flow of 200 to 300 barrels daily from each well.

IT is reported that in the Diamond Hill mines in Montana, which were lately purchased by a Scotch syndicate, a new vein of rich free milling ore has been discovered. The machinery for the new 140-stamp mill to be erected at this property has been ordered in San Francisco.

SOME people at Needles are looking into a proposition to put a big pumping plant on the Colorado river, near old Liverpool landing, to pump water across the range to work the big placer grounds on the eastern slope. There are said to be rich deposits in the Chimehuevas mountains.

HEMRICH, HEDGES & BROWN have bought the property of the San Jose Mining Company, Eagle canyon, Cherry Creek, for $30,000, and will put in a cyanide plant. This property was formerly superintended by Gen. W. S. Rosecrans, when owned and worked by the Donohoe-Kelly bank of San Francisco.

LAST week the result of the "washup" of the Cariboo placer mine in British Columbia for 80 days' run was shipped to Montreal. It was in a single cone-shaped mass weighing 400 pounds and was valued at $81,622. The mine is in charge of J. B. Hobson, formerly of Placer county, in this State.

THE seventy-first meeting of the American Institute of Mining Engineers will be held at Denver, Col., beginning on Monday, September 21st. The programme as announced by the secretary includes several excursions to Cripple Creek, Leadville and other points in the Colorado mining regions.

THE Blue Lakes Water Company is making contracts for an 1800-horse power electric plant, to operate at 10,000 volts, to be erected about a mile from Mokelumne Hill for the purpose of supplying power to the mines in Amador and Calaveras counties. It is proposed eventually to take power on to Stockton.

AT the Broken Hill Proprietary, Australia, for the four weeks ending August 20, the amount of ore treated was 32,182 tons. Refinery products: gold, 450 ozs., fine; silver, 561,241 ozs., fine; soft lead, 1,079 tons; antimonial lead, 20 tons; copper matte, containing 219 tons, 54 tons copper, 34,198 ozs. fine silver.

THE season of forest fires has opened, and there is reported considerable destruction in the Sierras about Tahoe and throughout Idaho, Washington and British Columbia. In the Slocan country the miners are having some difficulty from this source, and, in cases, prospectors are driven out of the mountains.

A PRELIMINARY report of the census of Johannesburg shows the total population to be 102,714. Of these 51,225 are whites, 44,396 native aborigines, and 7093 mixed races. Of the adults there are 72,000 males, against only 14,000 females. Of the white population there are 25,000 adult males, against 10,000 females, above fifteen years of age.

THE manager of the Gold Ore Treatment Co., Coolgardie, West Australia, reports that by the bromo-cyanide process tailings from mines at Menzies, treated with a 2 per cent cyanide of potassium solution and .05 per cent cyanogen bromide secured 14 dwts. 5 grs. per ton from tailings averaging 16 dwts. 8 grs. per ton in twenty hours.

THE Steeple Rock Development Company has secured control of over 100 mining claims, chiefly gold propositions in the Carlisle and Steeple Rock districts. A force of miners has been employed for more than a year in the development of mines owned or bonded by the company, and a quantity of ore is exposed and ready to be taken out.

THE number of names in the great register of Calaveras county this year is 3900, against 3620 for 1894—an indication that the mining industry of that county is not on the wane. A census showing the increase of the population of the different counties of California during the past two years would show the mining counties far in the lead.

AT the Gagnon mine in Montana a safety device has been adopted, consisting of an electric alarm system in the various workings of the mine, so that in case of fire the miners can be at once notified of its location. The mine has also been wired in duplicate so that the electricity from the city current can be used in case of accident to its own plant.

THE following advertisement appeared lately in a southern Oregon paper: "One-fourth interest in a mining claim in the Applegate district, that assays gold, silver, lead and copper, for a No. 1 team, wagon and harness; team to weigh not less than 2400; mares preferred. It will pay some one who has horses to sell to investigate this proposition."

THE *Democratic Times* of Jacksonville, Oregon, says: "Among the lands included in the patents to the railroad company, recently filed, are several tracts which have been claimed as mineral for several years, and against the patenting of which the owners filed protests. They are quite anxious to know why their contests were ignored."

SUBSCRIPTIONS are being invited in London for shares in the "Gold Fields of Mexico, Limited," capital £100,000, of which £60,000 is being issued. The company is formed to carry on business as a promoting financial and mining company, and its first enterprise will be to purchase and deal with the auriferous district of Huruapa, Chihuahua, Mexico.

SINCE the great increase in the consumption of cyanide of potassium, most of which made in Europe came from England, German chemical firms have engaged in competition with immediate and overpowering effect. According to *Industries and Iron*, an English journal, not only is their chemical cheaper, but it is purer than that of English make.

GOVERNMENT commissioners are treating with the Fort Hall Indians of Idaho, Uintahs of Utah, Agriemas of Washington, and the Crows, Cheyennes and Flatheads of Montana, to agree on a certain portion of the Fort Hall reservation south of Ross Fork and surrounding Pocatello, to be cut off and placed on public sale. This strip comprises a large area of mineral lands.

IT is announced that the Silver King of Park City, Utah, which has paid $787,000 in dividends, will, while lead is so low, keep their supply out of the market and cease paying dividends for a time. The suspension of dividends will reduce the income of the stockholders by $112,500 for the remainder of the present year, unless there should be a marked advance in the price of lead.

THE Minas Prietas and La Colorado mines of Sonora, Mexico, have been purchased by an English company which has a capital of £250,000 in £1 shares. The mines were examined and reported on for the Exploration Company by Henry Janin of this city and John B. Farrish of Denver, Col. The output of the mine was $111,000 in June; July, same amount; first half of August, $117,000, with 33 stamps running.

SHORTLY before his death the late William L. Ralston of this city opened up some big mines in Owyhee county, Idaho, but they were closed down shortly after his death and have not been worked since. Lately the Spokane and South Mountain Mining and Milling Company was incorporated with a capital of $3,000,000 to take hold of and work them. It is proposed to build a railroad from Booneville to the mines.

IT IS claimed that the gold product of the Black Hills for the present year will be $10,000,000, with a probability of reaching $12,000,000. The estimate is based on the product of the mines now in operation for the past eight months, which have averaged 15,000 tons per month of siliceous ores from the Bald mountain section and 500 tons of the same character of ore per month from Yellow Creek camp and the properties in and around Lead. The output of free milling ores will aggregate for the year, in round numbers, 950,000 tons, principally by the Homestake and associate companies.

THE announcement of intention to close down the Mingo smelter near Salt Lake and the notification by the manager of the Germania lead works, located near the same place, that until further notice the rates for the treatment of the low-grade ores worked there would be increased $1.50 and $2 per ton, has had a depressing effect upon ore shippers. Heretofore the uniform charge has been $4 per ton, but by the new schedule it is increased to $5.50 and $6.

THE Denver *Mining Industry* says: "In California, according to the California Mining Bureau, there are almost twice as many mines in operation, employing a corresponding increase of miners, as there were one year ago. It is the only State in the West which officially tries to obtain facts, and publish the same, regarding the mining industry, consequently no one can tell, except in a general way, whether there is any improvement in the mining situation compared with one year ago."

THE first gold obtained in California was found in the southern part of the State before Marshall made his discovery at Sutter's mill in El Dorado county, and yet that part of the State has done little compared with the mines of the north. However, with the great number of discoveries of good mines within the past year, it promises to produce a large amount of bullion. The want of water and timber has been a drawback to mining on a small scale, and without large capital, but the value of mines in San Bernardino, San Diego and Los Angeles counties lately opened promises to force the attention of the mining world.

THE Rossland *Miner* claims that through the development of the mines British Columbia will in a few years have a population of a million, and says: "Much of the population at present is American and transient in character, but as time moves on and the possibilities of the country disclose themselves many of these enterprising Americans will become permanent residents, if not qualified subjects. Americans find the atmosphere of British Columbia a very congenial one. They like the respect for law and order everywhere apparent. They like the security afforded to property and business. They like the way labor is protected as well as capital."

W. A. CARLYLE, the provincial mineralogist, in a bulletin on the Trail Creek mines says that the output from Rossland this year will not show the predicted increase over that of last year for several reasons, although there is now much high-grade ore in sight. In the first place, better and cheaper means for transport of ore are being awaited, as the shipping mines are now in such position that they can afford to hold back their shipments for better rates. Again, the smelters have not until recently been in such working order as to be able to handle anywhere near the amount of ore it is proposed to treat. In some cases shipments have been suspended on account of the properties being bonded, or until the completion of underground workings that will make mining more advantageous.

THE first contest of the rock-drilling series took place last Monday evening at the State Fair at Sacramento. Each team was to work fifteen minutes on a perpendicular hole in a block of Folsom granite, and make as many changes as they desired. There were three prizes effered of $200, $150 and $50. Four teams were entered, as follows: First team—Frank F. Esola and A. L. Noce of Amador City; second team—J. M. Ketto and William Hancock of Sutter Creek; third team—S. B. Harvey and J. Jefford, of Jackson, Amador county; fourth team—James Browan and E. Pope of Coulterville. A great deal of interest was manifested, the crowd deserting the main hall for the machinery hall while the contest was in progress. Noce and Esola won the first prize, drilling 33 5-16 inches; Pope and Browan second, with 28 11-16 inches, and Jefford and Hancock third with 28 7-16 inches; Ketto and Harvey making 28 1-16 inches.

THE Northwest Mining Association will hold its second annual convention October 6th, 7th and 8th in Spokane, Wash. It is expected that 2000 miners will attend. The rapid growth of the mining industry in the Northwestern States and British Columbia has turned the attention of the people of all that country to mining more than anything else. During the past year the Mining Association has appointed 225 vice-presidents, each representing a separate local branch organization, all within the States of Washington, Montana, Idaho, Oregon and the Province of British Columbia. Each of these branches will send a delegation of one member for each five members of the branch. During the convention there will be held an exhibition at Spokane of crude ores, concentrates, bullion and of mining machinery and methods. An important feature of the convention will be the reading of papers by leading mining engineers and geologists of the Northwest.

THE African *Mining Journal*, speaking of the Jameson matter, says: "It is just seven months since Dr. Jameson made his bold bid for a united South Africa, and the sentence imposed on Thursday adequately conveys the sense of his contemporaries upon his mistake. The feeling is, generally, that since the attempt failed, Dr. Jameson and his companions are men enough to accept the consequences of their defeat, and that anything like wailing appeals for mitigation of punishment are in the highest degree undesirable. It is reported by the Government organ here that two members of the English Parliament have communicated with President Kruger, asking for his intercession on behalf of the prisoners. We can only hope that this is untrue; for if it be correct, those members of Parliament should be promptly hung. Their constituents should certainly have something to say to them. It is reported that the Executive Council at Pretoria met on the receipt of the news of the sentences, and cabled its desire that clemency should be exhibited towards the prisoners, intimating that it had no feeling against them, but rather wished to see the organizers of the raid brought to justice. An act of this kind is merely another appeal to the little Englander party and to the Liberals to exert their influence against Lord Salisbury's Cabinet, in the hope that it can be overthrown. It is a move to increase the reputation of President Kruger, in order to bring into stronger relief the wickedness and rascality of his opponents who planned to injure his innocence. Astute as it is, it must be sincerely hoped that the Imperial Government will refuse to be entrapped, and will for the present leave Jameson and his friends where they are. If one other thing were needed to overwhelm the whole raid and revolution in ridicule, it is their release after a few days of Holloway jail."

The Accumulation of Amalgam on Copper Plates.*

NUMBER IV—CONCLUDED.

Communications in discussion of the paper of MR. R. T. BAYLISS, presented at the Pittsburg meeting.

The experiments were carried on with very soft and "wet" plates, and it is to be presumed that such conditions would favor early absorption. Certainly there is no possibility of accumulations of hard amalgam to any considerable thickness on the plates of the Standard Company's mill, and it will be admitted that a coating of $\frac{16}{100}$ to $\frac{1}{16}$ inch is, to say the least, extraordinary. It would seem that a judicious use of the steel scraper would have prevented this, with no appreciable harm to the plates. The plates in the Standard mill have been relieved of the harder amalgam with a steel scraper for four and one-half years, and are to-day in prime condition.

The second point of the high silver ratio of the adhering amalgam can, to a large extent at least, be traced to the stiffness of silver amalgam, which is a very noticeable feature of it. This would resist removal by the rubber scraper more than the softer gold amalgam.

In this connection it would have been interesting to have had recorded the ratio of silver to gold in the bar resulting from the destruction of the plate, for comparison with the ratio in the amalgam. In the experiments here recorded it is noticeable that the ratio is but 10 to 14 parts silver to 100 parts gold, while the average plate amalgam gives about 75 silver to 100 gold. The plate, then, exerts a straining action, being more permeable to gold than to silver amalgam. This is borne out by the extra tests on an old piece of copper sluice plate. The amalgam scraped from its surface carried gold and silver in the ratio of 100 : 77, while the plate itself showed but 100 : 17.

The whole question is one of commercial as well as scientific interest, and Mr. Bayliss should be thanked by all concerned in gold milling for having drawn attention to the facts.

Some additional experiments have been undertaken with the view of gaining data from more extended exposures to amalgam, and these will be reported to the Institute in due time.

MR. BAYLISS: The interesting contributions to this discussion call for some notice and a few remarks in reply.

Mr. Godshall, in considering "the change in the relative quantity of the two metals in the scale amalgam as we recede from the battery discharge," accounts for the increasing proportion of silver on the thery that the gold in the ore amalgamates more easily, and, therefore, more quickly, than silver; but, in seeking for an explanation of the fact that the fineness of the bullion from scale amalgam differs so widely from the fineness of the bullion from the daily cleanups, he suggests that, after the two metals have passed into the form of amalgam, the silver therein contained has a greater affinity for the amalgamated (or scale-forming) surface than gold, and goes on to suggest that I have not taken into consideration that "the condition of the native silver in the ore may be very different, or its behavior very different, from that of the same silver after amalgamation." In this distinction he finds a solution of the problem.

I submit this distinction is a very subtle one, and freely admit that I am unacquainted with the fact that the process of amalgamation reverses the relative affinity of gold and silver for an amalgamated surface, if any such difference exists.

The experience of Mr. Collins in the Hidden Treasure mill at Black Hawk, Col., does not appear to be quite in line with the case under review, as his mill was largely employed in the treatment of custom ores, which, if paid for on mill returns (as would seem to be the practice), would necessitate the careful recovery of accumulated amalgam after each operation. It is, however, of interest to note that the value of Mr. Collins' plates after they had been thoroughly scoured, as determined by the Argo smelting works—namely, 8 ounces of fine gold per plate—corresponds very closely with the experience in the Drum Lummon mill, where the gold contents of a plate, after the removal of the scale, amounts to 8.96 ounces.

Mr. Collins, with some force and great fairness, challenges the practice of permitting the accumulation of amalgam as neither necessary nor advisable. I should be indisposed to defend such practice as a universal or arbitrary principle; for I am satisfied that special causes contribute to the accumulation of amalgam in the Drum Lummon mill in such a marked degree. But in this particular case the practice seems to be justified by the fact that careful records of the daily pulp and tailing samples taken from batteries served, on the one hand by a plate coated with this scale and on the other hand by a plate not so coated, and also, in another case, by a plate from which the scale had been removed by a steel scraper, proved beyond question that there was in the first instance an additional percentage of gold recovered, which completely outweighed the undoubted disadvantages of the practice, such as loss of interest on money, risk of possible loss from fire, etc. Moreover, the necessity for the practice in the Drum Lummon mill has been proved by the fact that it has been found impossible to remove the scale, which is extremely hard, by means of a steel scraper without injury to the plate itself and the destruction of its amalgamating efficiency.

Messrs. Brown and Turner seem to have mistaken the object in view in the substitution of new plates for old after the accumulated scale has been removed, inasmuch as they point to the result of their very interesting and complete experiment on the period covered by the absorption of amalgam by a new plate as evidence "that the destruction of plates for the sake of the absorbed amalgam may be poor economy." This impression on their part may be removed by the statement that the new plates are not substituted for the old for the purpose of recovering the amalgam still remaining on the latter, but because the drastic treatment to which the old plates have been subjected in the removal of the scale, as fully described in my paper, renders them wholly unfit for further use.

They remark also that "the high silver ratio of the adhering amalgam can, to a large extent at least, be traced to the stiffness of silver amalgam, which would resist removal by the rubber scraper more than the softer gold amalgam." In the case under discussion it is not possible to subscribe to this theory because experience tends to prove that the silver amalgam obtained from the Drum Lummon ores is not so stiff and solid as the gold amalgam.

The inquiry of Messrs. Brown and Turner as to "the ratio of silver to gold in the bar resulting from the destruction of the plate" reveals a strange conflict, in the case under discussion, with the results obtained by them in the experiment to test the absorption of gold and silver by copper plates. They report that the metal absorbed was in the ratio of "but 10 to 14 parts of silver to 100 parts of gold, while the average plate amalgam gave about 75 silver to 100 gold."

The copper plate at the Drum Lummon mill, on the other hand, upon being run into a bar, was found to contain 8.96 ounces gold and 9.62 ounces silver, or in the ratio of 98 parts gold to 100 parts silver; whereas the average plate amalgam from daily cleanups gives 82 parts of silver to 100 parts of gold, showing, in this instance, that the plate was apparently more permeable to silver than to gold amalgam, instead of the reverse, as proved by the tests in the Standard Consolidated mill.

And, completing the comparison by ratio throughout each stage of the amalgam obtained from the plate in question, we find:

1. Amalgam from cleanups contains gold 100, silver 82.
2. Amalgam from accumulated scale contains silver 100, gold 76.
3. Amalgam from vanner plates contains silver 100, gold 63.
4. Gold and silver absorbed in plates, gold 100, silver 93.

In conclusion, I submit that we must look to chemical, and not to mechanical, causes for the explanation of the two important facts raised in this discussion, namely, the excessive accumulation of scale and the variation in the relative value of gold and silver in the amalgam taken off the plates from day to day, as compared with that remaining on them in the form of scale. It is a question which I must, of necessity, leave in more capable hands, but in the solution of which I shall be pleased to assist by affording all the information at my command.

*Trans. Am. Inst. M. E., February, '96, meeting.

Vein Walls.*

NUMBER IV—CONCLUDED.

By T. A. RICKARD, State Geologist of Colorado.

(Condensed.)

This specimen, and numerous similar structures in the same mine, indicate that the rhodochrosite was the first laid down, replacing, in part at least, the crushed rock which encased an original line of fault-fissuring. Subsequently another fracturing occurred, and this time the line of least resistance was the rhodochrosite itself, which, being homogeneous, broke down its center. The shattered carbonate offered an easy prey to the sulphide-bearing waters which laid down the blende and galena. The presence of bits of rhodochrosite within the sulphide band indicates that the substitution was irregular. Later, new disturbing forces were at play and the vein was fractured, not only along its middle, as heretofore, but also along the lines of its contact with the encasing rock. These fractures were healed by the deposition of quartz, accompanied first by iron and copper pyrite, and then by rich silver-bearing minerals, such as the stephanite. The corrosion of the sandstone on the hanging had on that side irregularly widened the vein, so as to give it greater strength; therefore, the next movement—the last—took place along the footwall. This, apparently, resulted in nothing save the crushing of some of the encasing rock and the formation of a selvage, whose removal produced the cavity which was so striking a feature of the stope.

Another typical illustration of this structure is presented by the Amethyst-Last Chance vein, at Creede, Col., which is certainly a magnificent example of an ore break. The country rock, trachyte, has undergone multiple fracturing and ore has been deposited along the division planes, so that there are walls *ad libitum*. The regular ribbon structure produced by the deposition of agatized quartz in a sheeted rock is very beautifully marked, and the same process of silicification is further evidenced in those places where the lode consists of breccia, composed of pieces of country rock covered by concentric layers of agate. The lode itself is much wider than the pay streak of silver ore, which usually follows the footwall. On the hanging the boundary between vein and country is fairly discernible; on the foot less so, because for several feet beyond the ore there is a red jasperoid, which gradates into country.

In the Enterprise example each succeeding fracture occurred in the mineral deposit which had healed the previous fracture. In other instances the mineral deposit appears to have proved harder than the encasing rock, and the second fracturing took place near the original one, but in the soft rock, rather than in the hard vein, thereby producing a new break parallel to the first one, and close to it, causing a repetition of vein walls such as have already been described. Or there may be the production of companion fissures forming contemporaneous veins. Finally, the companion fissures may be so multiplied as to cause a sheeting of the country and the formation either of one vein and several, subordinate, smaller and parallel to it, or of a series of ore streaks united by mineralized country, so as to form one large lode.

The evidence of a multiplicity of fracturing, whether successive or contemporaneous, is the clue, I venture to believe, to many of the anomalies of vein structure. No district within my knowledge so well illustrates this aspect of the inquiry as Colorado's new El Dorado, Cripple Creek, in El Paso county, where gold veins occur as mineralized and enriched portions of dikes, phonolite and basalt, traversing masses of andesite tuff and breccia. Other types are observable, but these are to-day the most characteristic. The mineralized rock forming the vein and that less distinctly gold-bearing country which encloses it, have been subjected to such multiple fissuring as to produce a very marked division of the rock into parallel bands or sheets which may be a fraction of an inch apart or several yards. This structure can be seen no less in hand specimens than in blocks an acre big.

Cases also occur where there can be discerned a combination of both these types of multiple fissuring.

A line of weakness, or even a region of weakness, once developed in the earth's crust, is apt to continue to be a line of least resistance available for future fracturing. Even when a quartz vein is formed along a line of rupture, healing the break and strengthening it with a substance harder than the rock walls themselves, we may suppose that the next break will take place along the line of weakness presented by the imperfect cohesion existing along the plane of contact between the hard quartz and the less resisting rock.

The gradual penetration of mineral solutions into the immediately encasing country may finally obliterate the divisions due to multiple fissuring. The sheets of rock separating one from the other would be replaced by ore, and nothing might remain of the original structure save faint partings in the lode, such as are less evident to the eye than to the hand of the miner who instinctively uses them to assist him in breaking ore.

Thus, I believe, the collection of observations in various mining districts tends to the modification of that idea of clean-cut definition which accompanied the early ideas of vein structure. The evident contact between two dissimilar rocks, such as is seen along the walls of a dike, will be often found in veins to be replaced by an indistinct gradation from mineralized to unmineralized rock, originally the same, but now rendered unlike by the selecting action of chemical solutions.

We are justified, however, in putting some limit to the depth of possible ore formation, since that formation is dependent on the presence of water. The record of the largest number of careful observations has shown that as we sink into the earth the increment of temperature is 1° F. per each 48 feet of descent. At this rate the critical point of water would be reached at 34,704 feet, or 6⅔ miles from the surface. Where the temperature is that of the critical point (773° F.) water cannot exist as a liquid, no matter how great the pressure, but becomes dissociated into its gaseous elements. Moreover, we are warranted in believing that the thermometrical gradient becomes more rapid at depths beyond those reached by human observation, because of a decreased conductivity in the rocks, or, as Prof. Prestwich, the best authority on these matters, puts it:

> Taking into consideration the probable limitation of the percolation of water, and the possible diminution of conductivity with increase of depth, if there should be any alteration in the thermometric gradient, at great depth, it will be more likely to be in the direction influenced by these more or less certain factors.

Therefore, taking these conditions into consideration, we may expect the circulation of water to cease

*Trans. Am. Inst. M. E.

at 20,000 feet or thereabout; but at the maximum depth the maxima of temperature and pressure must obtain. It must necessarily be a horizon of solution. Precipitation would hardly begin until a lowering of the temperature and a lessening of pressure permitted it. The deposition of ore is the direct result of precipitation; therefore, actual ore formation is likely to be limited to a depth often of 15,000 feet.

It is not difficult to surmise why clean-cut fractures are not necessarily most favorable to ore occurrence. In the Drum Lummon mine, Montana, the distribution of the ore appears to be connected with the change in the angle of intersection between the course of the veins and the strike of the slate country. Most of the ore bodies have been found where the course of the veins (N. 15° E.) cuts the slates at an oblique angle, and the levels run out of ore when their direction is either at right angles to, or conforms with, the strike of the country (N. 17° W).

In one of the surface workings of that mine which illustrates in miniature the fact above noted, is a small quartz seam, 2 inches wide, traversing the slates, whose structure is very clearly marked by the color bands following lines of original sedimentatation. The quartz follows a joint and becomes narrowed, while where it crosses (along a line of slight dislocation) the country, it has irregularities and bulges which answer to the alternating slate-bands. A rough, ragged fracture, when continuous, may be expected to offer more surface to solvent action and more, but not too many, obstacles to a rapid circulation of underground waters. Its structure also means more opposition to the closing in of the walls, because the irregular faces of the fracture, when they come together, leave openings which, if not along one section then along another, have inter-communication, and so permit of a passage which would be badly impeded, if not absolutely stopped, by the closing in of smooth walls.

This underground work bears daily testimony to the close dependence of ore occurrence upon the geological structure of the enclosing country, a relation the importance of which Mr. S. F. Emmons has done invaluable service by clearly stating in more than one of his contributions to the *Transactions*. Wanting a proper understanding of the structure of the rock encasing his vein, the miner gropes but blindly in a maze of tangled phenomena until the geologist, by their proper elucidation, gives him a light which dissipates much of the darkness obscuring his progress underground.

THE following is a list of the principal exhibitions open, so far as the engineering industries are concerned, and of those which will be opened in various parts of the world before the end of the century. 1896:—Industrial and Fine Arts, Odessa; International, Cannes; National, Geneva; Industrial, Berlin; International, Mexico; Exhibition at Para; Exhibition at Johannesburg; Industrial Arts, Barcelona; International Mining and Industrial, Denver (Colorado); Agricultural Machinery, Vienna; National Nijni-Novgorod; Motors and Automatic Carriages, Agricultural Hall, London. 1897:—International, Brussels; Rio Janeiro Exhibition; Central American, Guatemala; Exhibition at Brisbane; Exhibition at Stockholm; International, Montreal; International Industrial and Fine Arts, Nashville (Tennessee). 1898:—Universal, Amsterdam; Exhibition at St. Paul, Brazil; Exhibition at Turin. 1899:—Exhibition at Adelaide. 1900:—Universal Exhibition at Paris. —Industries and Iron.

ABOUT 400,000 hectares (nearly 1,000,000 acres) of land in the valley of the Rio Sonora, State of Sonora, will be put under irrigation by the construction of the irrigating works near Hermosillo, the contract for which was recently let. The plant will be completed in three years, though water will be supplied to a portion of the land in twelve months from the time work begins.

Electrical Progress.

Operation of the Nantasket Beach Train by Electricity.

The favor with which the electric operation of the Nantasket Beach branch of the New York, New Haven & Hartford Railroad has met with from the visitors to Boston's pleasure resort at Nantasket Beach is phenomenal. It has served to confirm the predictions of the engineers of the railroad as well as of the General Electric Company, whose system was adopted. Given a comfortably seated car, open to all the cooling breezes on a hot day, unafflicted by the plague of dust from the dry track or cinders and smoke from the steam locomotive, and the prophecy that the public would avail itself largely of the privilege of riding was not difficult of realization.

Electric operation of the Nantasket Beach branch was in June last extended as far east as Weymouth, in the direction of Boston, on the main line of the Old Colony Dominion. On the new line, however, the overhead conductor is not used. A third rail laid between the rails of the surface track takes the place of the trolley wire, and although this is the first instance of a third rail electrical conductor being laid between the tracks of a steam railroad, some measure of failure might consequently be looked for. However, the cars have been regularly operated over it between the regular steam trains without hitch or difficulty. In the operation of the cars the change from the overhead trolley to the third rail source of power is made imperceptible. When the car approaches the end of the trolley wire a knife switch under the hood of the car is closed, connecting the shoe beneath the car with the motor circuit, the trolley slides off the overhead wire and is hooked down, the car meanwhile continuing on its journey. On the day of the inauguration of the third rail section several high speed spurts were made, and these have frequently been exceeded in the actual service.

The illustration shows the car house of the first electrical division of the New York, New Haven & Hartford Railroad, adjoining power house No. 1, a corner of which is shown to the left. The car house has four pits, over which the cars may be run for examination of the motors, and is fully equipped with all the necessary appliances.

CAR HOUSE AND TRAINS ON THE ELECTRICAL DIVISION OF THE N. Y., N. H. & H. RAILROAD.

Path for the Return Current.

The practice heretofore in electrical railroad building has been to furnish no definite adequate path for the return current. They have relied in the main on what is vaguely known as the "earth" return. This term, "earth return," as it is known in the cities, should be called the "water-pipe return," for the water pipes have been used right along in all the cities where electrical railroads have been introduced. In some cases the use has been intentional, and in others unintentional, but it has been done. The reason is because the water pipe offers a better path for the electricity than the earth does.

The current always follows the easiest path. The result of this loose use of the earth and water pipes has been the deterioration of the water pipes and gas pipes, causing leakage and making frequent repairs necessary. It has weakened the pipes till they burst. This has driven electrical engineers to devising methods of confining the current to the rails by making the rails an ample path for the current and insulating them from the surrounding earth and pipes. It is not now necessary in order to have a good electric road to connect with the water pipes. The whole aim of advanced electrical engineers has been to avoid using them, and they have lately succeeded.

A striking difference in the methods adopted on two electric roads in San Francisco and those under construction by the Market Street Railroad Company is that the former, intentionally or unintentionally, use the water-pipe return, as an auxiliary to their said return, whereas the latter will confine the current to the rails.

The current is confined to the rails in two ways: First, by bonding or connecting the abutting ends of the rails by large copper wires rigidly fitted into holes on each side. These wires are equal to or larger in size than the combined overhead wires. Second, by insulating the rails from the earth and the water pipes by 6 inches of broken stone under an 8-inch wooden tie.

It is well known that when an electric car is derailed, if the wheels are within even a few inches of the rails and wet earth intervenes, it is impossible to force enough electricity through this few inches of earth to move the car. Even the lights will have been suppressed, and remain out. When a few inches of moist earth serve to so completely shut out the current, it is clear that 6 inches of broken rock, 8 inches of wood, and probably 2 feet of intervening soil, will be ample to keep the current away from the water pipes.

A strange thing to most people will be the statement that the managers of earlier electric lines, in order to strengthen inadequate rail bonding, have dug holes in the ground, at intervals of, say, 1000 feet, and put in old worn-out car wheels, pieces of rails, or iron plates to connect the rails with the earth, which really amounts, in a city, to connecting with the water pipes.

Scientific Progress.

Recent Archaeological Discoveries.

A remarkable discovery was recently made in the Assiot necropolis in Egypt. Among the objects found was a whole company of wooden soldiers 15 inches in height. The soldiers carry lances and give a good idea of their equipment in the Pharaohs' time.

Recent investigations not far from Sebastopol have yielded some interesting finds. Near the French cemetery the discovery was made of what must have been the site of a very large Byzantine city, and objects of classical Greek art of great beauty have been brought to light.

The excavations among the ancient Greek ruins at Eretria have been carried on some years by the American School of Classical Studies at Athens. The gymnasium and other buildings which have been uncovered are probably part of the buildings on each side of the ancient street laid bare last year between the theater and the naval school of King Otho.

In the course of further excavations in the island of Melos, by the director and students of the British School of Athens, one of the most important discoveries has been that of a mosaic which is believed to be the finest yet found in Greece. More recently the excavators have come upon a series of graves of the sixth century B. C., in one of which was found a number of ornaments in gold and silver. In another (Roman) tomb was found a series of gold leaves from a wreath, and a gold ring was a fine subject in cameo.

The trained workmen who have for some years been making excavations in order to explore the remains of the Roman city of Calleva, at Silchester, have very recently opened up several additional buildings, one of them with a very interesting hypocaust showing some unusual features, while others are believed to have been used as dyers' workshops. There was also found an earthenware pot containing 253 silver denarii, ranging in date from B. C. 40 to A. D. 211, though there have been also many objects in gold, bronze, metal, bone and glass, much pottery, and a fine slab of Purbeck marble. The previous discovery of numerous wells, stone hand mills, furnaces, etc., seems, in connection with the buildings disclosed by the latest excavations, to leave no doubt that extensive dye works were once carried on in the buried city.

At a recent meeting in London of the Egypt Exploration Fund, D. G. Hogarth, the well-known explorer, said, that the excavations of last season had convinced him that there was

no hope of the preservation of any of the contents of the libraries of Alexandria within the city. Not only has the subsoil water risen generally above the Roman level, but, even where the water does not reach, there is a great deal of damp sucked up by capillary attraction, so that there is no chance, even if any papyri were found in Alexandria, of their being legible at the present day. One of the main reasons for stopping the work at Alexandria was that even below the water level everything was found to be in the utmost state of ruin. After the Arab conquest, any of the books which remained would naturally drift from Alexandria to Cairo. It is not, however, in the rainy delta that they must be sought, he declared, but higher up the Nile, where man has been less active. It is only to Egypt, he said, that we can look with any confidence, to the Fayum and to the dry upper valley of the Nile, for the best classics —perhaps for Sappho and Menander—and for the missing early Christian literature.—Scientific American.

IN the mining and foundry district of Bochum, Prussia, Dr. Nieden reports having treated during the years 1885–94, 5443 patients engaged in such occupations, of whom more than 68 per cent were cases of injury to the eye in their calling, iron and foundry workers showing a large predominance in this respect over miners. Of 3723 iron and foundry workers treated for eye injuries, 2805 were for the left eye and only 1638 for the right, or a relative proportion of 56 to 44; and, as a similar proportion held good in each separate year, the conclusion arrived at is that in such work the danger to the left eye is really greater than that to the right. Even more marked, in fact, was the proportion in respect to the severe cases, the left eye being quite lost in seventeen cases, the right only in seven. It is urged, therefore, that in iron workers the loss of the right eye should be calculated as the more serious, inasmuch as the individual then runs a greater risk of injuring the remaining eye than when he has lost the left.

AT the Blue Hill observatory near Boston, Mass., on August 20, Charles H. Lamson, using a cellular or box kite, built somewhat on the Hargraves model, succeeded in lifting a weight of 150 pounds, designed to represent a man, to a height, as reported, of 600 feet. The kite was started from the ground with a length of 400 feet of rope paid out. It then, as released, rose steadily without any jerking until, as the altitude of 600 feet was reached, the rope parted. The kite floated off about half a mile down the wind, and is said to have reached the surface so gently that, had a real man been carried by it, he would not have been injured. The kite includes a number of features that distinguish it from any other. The relations of the cells to each other can be changed by manipulating a lever, and if a passenger were carried by it, this and other means enable him to materially change the course and the position of the kite and also to direct its descent.

DAMAGE by lightning is unmistakably increasing, according to the director of the statistical office of Berlin. Various causes are assigned, such as the employment of electricity in various industries, the continual change of form of the earth's surface by deforestation, drainage, etc., and the impurities introduced into the atmosphere by the growing consumption of coal. Professor Von Bezold some time ago showed that for Bavaria the fires due to lightning increased from a yearly average of 32 in 1833, to 1843 to 132 in 1880 to 1882, while the number of persons struck by lightning and of those killed rose from 134 and 73 respectively in 1855 to 186 and 161 in 1885. An interesting fact noted is that persons struck generally perceive neither lightning nor thunder, but receive the impression of being enveloped by fire.

Mechanical Progress.

Force of Water Pressure.

A crushed mass of cast metal now lying in a scrap yard at Pittsburg demonstrates the tremendous pressure of water at a great depth. It was constructed for a diving bell, and was intended for use in Lake Michigan. As originally constructed, it was a cube about six feet square, tapering slightly at both ends. The material was phosphor bronze, five-eighths of an inch thick. Each plate was cast with a flange and they were bolted together, the bolts being placed as closely together as was consistent with strength. The side plates were further strengthened by ribs an inch thick and two inches wide, and the entire structure was strongly braced. The windows, intended to be used as outlooks by the divers inside, were three inches square, fortified with iron bars and set with glass plates an inch thick. The entire weight of the bell was 23,000 pounds. When completed, it was sent to Milwaukee and towed out into the lake about twelve miles, where there was over 200 feet of water, and was sent down for a test.

The manufacturer of the bell was so confident of its strength that he wanted to go down in it on the test trip. It was well he did not. When it had reached a depth of about 200 feet, strong timbers which had been attached to it came to the surface in a splintered condition. Suspecting an accident, the bell was hauled up and found to be crushed into a shapeless mass. The inch-thick plate glass bull's eyes were pulverized and the entire body of the bell forced inward until none of its original outlines remained. On a basis of 200 feet depth, the pressure that crushed this seemingly invulnerable structure was 86.8 pounds per square inch, or 353,924 pounds to each side of six feet square. The total pressure, therefore, on the cube was 2,723,548 pounds, or 1361.7 tons.—The Foundry.

ONE of the earliest necessities of the primitive founder was a form of apparatus for handling the materials, and crude appliances for this purpose are known to have existed from a very early period. It may, however, surprise those who have not investigated the subject historically to learn that records are extant showing that even the Egyptians possessed elaborately constructed derricks and other hoisting appliances, says A. E. Outerbridge Jr. A gentleman who recently returned from an extended tour in that land of antiquity informed me that one of the most interesting places he visited while in Egypt was a large chamber or vault in the interior of one of the pyramids which contained the sarcophagus of the king who caused its construction. The walls of this room were lined with large slabs of stone upon which were carved, in low relief, hundreds of figures, illustrating the method of constructing the pyramid, including the quarrying of the stone. The representations of derricks and other apparatus, with winches, ropes, etc., for hoisting and moving the large stones resembled many of the appliances for similar uses which may be seen in parts of Europe even at this day.

THE British Board of Trade publishes the following table of exports of iron and steel products to the United States:

	JULY.		SEVEN MONTHS.	
	1895.	*1896.*	*1895.*	*1896.*
	Tons.	*Tons.*	*Tons.*	*Tons.*
Pig iron	2,484	2,423	9 459	22,940
Bar, angle and bolt iron	117	167	783	1,109
Railroad iron and steel	.....	32	3,972	8,439
Hoops, sheets and boiler plates	718	2,022	1,164	4,136
Tin plates and sheets	16,445	13,930	124,839	73,552
Old iron	104	370	458	747
Steel, unwrought	1,293	1,062	8,672	8,834
Wire, iron and steel	353	116	3,367	1,864
Black plate for tinning	1,383	72	6,140	2,356
Totals	22,897	20,194	158,884	123,977

Taking exports during July, 1896, in comparison with those for July, 1895, there is a decrease of 10 per cent. A remarkable drop, and one indicating the development of the tin plate industry in this country, is shown in exports of black plate for tinning. The amount exported last month was 72 tons, but the total for July, 1895, was 1383 tons. Comparing the total exports during the seven months of this year with those of a similar period in 1895, we find a decrease of 21 per cent. This decrease is caused by the falling off in only three articles—tin plates, wire and black plates for tinning. The first, of course, was the largest. The drop in black plate exports was 62 per cent and the decrease in wire was 44 per cent. On the other hand, some lines show largely increased exports from Great Britain to the United States. Pig iron shows an increase of 58 per cent and bar iron exports are 41 per cent greater. An increase of 112 per cent is shown in steel rail exports, while hoops, sheets and boiler plates show an increase of 246 per cent. Scrap iron exports increased 66 per cent. In this period the increase in exports of black plate for tinning was 62 per cent, while wire shows a gain of about 44 per cent.

CHLORATE OF POTASH works are about to start up at Niagara, N. Y. This is the first plant of the kind in the United States, and it is predicted that it will revolutionize several branches of the chemical industry.

Practical Information.

Uncle Sam's Warships.

Furniture and supplies for Uncle Sam's new war vessels cost money. To fit out one of these ships for a cruise is a bigger job than equipping a first-class hotel. Here is a floating fortress as long as two city blocks, with all modern conveniences and complete restaurant facilities, lighted throughout by electricity—a gigantic fighting machine and military barracks combined. Her steel walls, bristling with guns, shelter a small army of men. The New York, for example, has a crew numbering 455, besides 40 marines and 44 officers. To feed them all for a twelve-month at the Government's rate of allowance costs $60,000.

On going into commission such a ship must be furnished throughout, from the kitchen, which is as complete as that of a great city hostelry, to the captain's cabin. She carries large stocks of stationery, hardware and apothecaries' goods, and is provided with tools for all sorts of trades. Everything conceivable that may be needed for purposes of war and peace is supplied, because on the high seas no shops or factories are accessible. Usually the vessel is provisioned for only three months, because there is no room to stow more. The rations are purchased by the Navy Department and comprise such necessities as hard bread, cornmeal, oatmeal, hominy, flour, salt pork, beans, peas, rice, preserved meats, butter, coffee and tea.

Every man in the navy, from the last boy shipped up to the admiral, has an allowance of 30 cents a day for rations, which he may draw either in food or in money. The paymaster of the ship has charge of all the provisions, which are dealt out by his "yeoman," who is in turn assisted by the jack-o'-dust. The person last named attends to opening the barrels and packages. Coffee and sugar are served out once in ten days, flour every four days and meats daily. While in port fresh provisions are furnished, each man receiving 1 pound of fresh bread, 1½ pounds of fresh meat and 1 pound of fresh vegetables per diem. These take the place of the ordinary rations, only tea and coffee being provided in addition. The allowance is at all times so liberal that the enlisted men cannot possibly consume the whole of it, so they take part of it in cash.

THE following table shows the gas prices being paid in a number of cities in this country:

CITIES.	Illuminating gas, per 1000 cubic feet	Illuminating gas, for heat, per 1000 cubic feet	Natural gas, per 1000 cubic feet
Cincinnati	$1.00	$1.00	.....
Cleveland	.80	.80	.....
Toledo	.80	.80	.20
St. Louis	.90	.80	.....
Canisteo, N. Y.	.50	.25	.....
Dayton, O.	1.00	1.00	.25
Buffalo, N. Y.	1.00	1.00	.25
Chicago (Hyde Park)	1.00	.72	.....
Detroit, Mich	1.00	.86	.30
Springfield, O.	.....	.....	.25
Indianapolis	.....	.....	.07
San Francisco	1.75	.....	.....

A WAY to test linen, by means of which the introduction of cotton among the linen threads may be detected, is to cut off a small piece of the material, to unravel the threads, and then to examine them under a strong magnifying glass. The characteristics of flax-threads are very marked. They are in the form of cylindrical stalks, divided at intervals by knots, in the same way as bamboo or sugarcane stalks. Cotton threads are long and flattened like ribbon, waved, twisted in spirals, and granulated on the surface.

LAST season the Manchester ship canal handled 65,510 bales of Egyptian and 120,713 bales of American cotton. The tonnage of American cotton this year will be larger, and a British paper states that arrangements have been made for frequent sailings of steamers direct from New Orleans and Galveston to Manchester.

—* Begun in issue of April 25, '96. (Concluded.)

Professional Cards.

HERBERT LANG,
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

WADE & WADE,
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

D. B. HUNTLEY,
Mining Engineer and Metallurgist,
TELLURIDE, - COLORADO.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Eighteen years' experience. Will report on Mines and Mills, and take full charge of Mining Properties. Address, 132 Market St., Room 15, San Francisco, Cal.

H. VAN F. FURMAN,
Mining Engineer and Metallurgist.
SPECIALTY:
SILVER, GOLD AND LEAD.
Room No. 118, Boston Building,
DENVER, COLORADO.

COBB & HESSELMEYER,
MECHANICAL ENGINEERS.
GENERAL MACHINERY.
HYDRAULICS, POWER, TESTS, ETC.
421 Market St., Cor. First St.,
Rooms 70 and 71.....San Francisco, Cal.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

Saville, MacLymont & Co.,
MINING and CONSULTING
Engineers and Metallurgists.
Examine and report on mines, ore bodies, and all metallurgical processes connected therewith.
Practical mill tests, assays and analyses of ores and general analytical work undertaken at the
CALIFORNIA METALLURGICAL WORKS,
10 Annie St., (opposite Palace Hotel),
Between Market and Mission Sts.,
SAN FRANCISCO, CAL.
References to leading mining men on application.

CHARLES P. GRIMWOOD,
Mining Engineer and Metallurgist,
Laboratory, 214 Pine St., San Francisco.

JOHN H. MEANS, Geologist & Mining Engineer.
Preliminary reports on mines to determine advisability of extended investigation; assists upon large examinations. Intricate surveying, and geologic work for lawsuits. Thorough experience. Abundant references. Anglo-American code. Address, 1016 Pine St., S. F., Cal.

Robert H. Postlethwaite,
Member Institute Electrical Engineers, London.
Carrville....Trinity County....California.
Having been engaged in the designing and construction of river dredgers for gold saving in New Zealand for some years, is prepared to furnish plans and advice.
☞ Correspondence invited.

Thomas B. Everett, M. E.
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

EDWARD C. BROADWELL,
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

PROFESSOR GEORGE DAVIDSON,
Late of U. S. Coast and Geodetic Survey.
Consulting Civil and Hydraulic Engineer.
GEORGE F. DAVIDSON,
Agent for Sale of Mines,
530 California Street, San Francisco, Cal.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Expertingin all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

W. B. TAYLOR. H. C. WARD.
C. A. LUCKHARDT & CO.,
Nevada Metallurgical Works.
ASSAYING, MILLING AND ANALYSIS OF ORES.
71 & 73 Stevenson St., San Francisco, Cal.

THE SANTA ROSA GOLD MINING COMPANY.
Properties located in the Cripple Creek Gold Mining District.
We believe we can give you the largest prospective value for the least money.
Investigate carefully; hesitate before buying other stocks; consider SANTA ROSA and know why you don't want it.
Call, write or telegraph to F. H. PETTINGELL, 10-11 Bank Block, Colorado Springs, Colo.

M. H. WALSH, Secretary and Manager. C. G. BACON, President.
Sonora Land and Mining Abstract Bureau.
Sonora, Tuolumne Co., Cal.
Abstract of Titles to all lands in Tuolumne County made under the Durfee Self-Correcting and Adjusting System.
Mining properties for sale or bonded on desirable terms. Correspondence invited from principals desiring investments in quartz mining properties or in the development of promising claims. Reliable information given on all matters.

Thomas Price & Son,
Assay Office, Sampling Works
And Chemical Laboratory.
524 Sacramento Street, San Francisco, Cal.

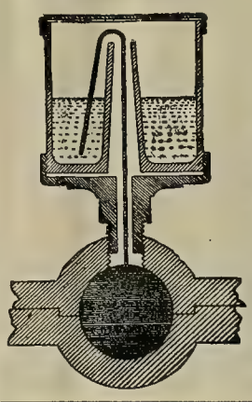
Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { **Brown's Complete Automatic Mill Process.**
Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces. Etc.

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

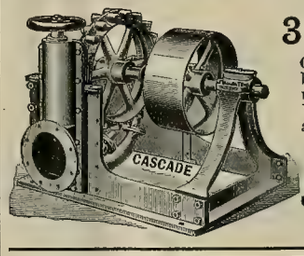
The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

TURBINE AND CASCADE WATER WHEEL
Adapted to all Heads from
3 Feet to 2000 Feet.



Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

Cycle Telegraphs In War.

Electrical communication plays an important part in the warfare of today, says the *Scientific American*. Special attention has been given by the Signal Corps of the United States Army to provisions for temporary telegraphic or telephonic communication. Flying telegraphic trains equipped with the most modern appliances are located at several Government stations in the West. Among pending experiments are those pertaining to insulators, wires, batteries and the most important one of the naked wire telephone.

The question of the reeling out and recovering of wire and outpost cable by bicycle, automatically, has come in for a considerable share of attention, and the results have been very satisfactory. The Signal Corps has now a bicycle equipped with an automatic reel that works perfectly. The attachment was made in San Antonio, Texas, under the supervision of its inventor, Captain R E. Thompson of the Signal Corps. The line was laid out and recovered at a moderate rate on the day of the first test. The speed was gradually increased, and it was found that the wire was paid out quickly. After dismounting for a moment to reverse the action, the officer began a return trip, keeping in the middle of the road and riding hard. The recovery was perfectly made, the wire being spooled evenly and the tension was at no time troublesome, although the course of the line was occasionally departed from by many feet, showing that the problem of compensating for increased speed of the recovery due to increasing bulk of the spool has been solved. The time occupied in running out and then picking up the reel of wire was two minutes, the reel holding about one-third of a mile of cable. Practical use has been made of the equipment in sending messages at other times than on the trial trip.

The cycle invented by Leo Kamm for laying telegraph wires for military purposes was employed at the recent Aldershot maneuvers in England. It consists of an ordinary pneumatic tired safety provided with two or three drums of wire of about four inches in diameter. On each of the spools is wound a twisted wire composed of fine steel thread. Each reel carries a mile of wire. The wire passes over a wheel connected with a telegraph receiver. As the rider travels the rotation of the bicycle unwinds the wire from the drum, leaving it on the ground. The bell rings before the wire is entirely paid out from the drum. When it is desired to send a message to the starting point, the rider dismounts and fixes in the ground an earth rod which is carried for that purpose. The apparatus for laying the wire weighs seven pounds, and each mile of wire weighs ten pounds.

AURIFEROUS PYRITES, whether in solid rock or in a loose condition, display the peculiar behavior that the gold uniformly distributed in the mass in the state of sulphide, in proportion as it is converted into an oxidized product, moves toward the middle of the mass. Hence the pyritic nucleus of a half-weathered crystal shows double the proportion of gold than does the average mineral before decomposition. In a fully weathered specimen the author found a granule of gold with crystalline surfaces. The confirmatory specimens were obtained from the Orenburg Government (Russia).—Berg-und Huttenmaenische Zeitung.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Mining Summary.

CALIFORNIA.

Amador.

Ledger: Ross E. Browne, general manager of the Oneida, is at the property giving his attention to the construction of the plant. The shaft was down 287 feet September 1st.

The recent purchasers of the Smith interest in the Reward mine have been prospecting on a large, supposed to be barren, ledge with an open cut. They have encountered a streak of pay.

J. R. Smith and F. Walker, who have been taking out rock from the Blakely Ranch to be milled, uncovered a new ledge a few days ago which gives $25 to the ton.

At the Bellwether the three-compartment working shaft is down 135 feet.

Republican: The Jackson Gate mine shaft is now 300 feet deep.

At the Consolidated gold mining property it isexpected that the repairs to the mill will be completed by October 15th. They are down to the 400 level and expect to put in a station at that point and then drift east and west. The company will keep on sinking to the depth of 850 feet, when they expect to strike the combination of both ledges. The work in the shaft is progressing satisfactorily. At present they are working at the mine sixty men.

Butte.

Mercury: W. W. McMillan, Jr., of the Resumption mine, above Hurleton, has started crushing ore from his mine in the Phœnix mill.

The big head dam of the Cherokee mine, in Butte creek, that has successfully turned the waters into the company's main ditch for a quarter of a century, which has been under process of construction for two months, will soon be completed. The litigation between the bondholders and the Bank of California, which has tied up the mine for ten years, only ended a few weeks since, in favor of the bondholders, the validity of the mortgage being finally upheld. Operations are expected to be resumed by this management itself at Cherokee before long. At present about 100 miners are working on a royalty in the blue gravel of the lead formerly abandoned by the company as worthless. But on the transfer of the mine into the control of the bondholders, which will occur as soon as the order for foreclosure sale can be had, some time in September, developments into the main channel will commence. The immense size of the lead, 800 feet wide and 20 feet thick, averaging over $2.50 a cubic yard will, open up one of the biggest drift mines in the State. Owing to the increasing height of the bank, some 500 feet, it is a certainty that the management will be compelled to change from the hydraulic to the drift system. With this method between 400 and 500 men could be employed.

Register: C. S. Beresford, who managed the Catskill mine for a long time, has returned to Butte, and it is stated that it is his intention to pay off all claims against the mine and open it up.

At the Napa and Solano Mining Company's property they are engaged in running a tunnel in search of the old channel that has proved so rich along Magalia ridge. They are now in some 800 feet, and expect to be able to reach the channel 200 feet farther along.

Calaveras.

Citizen: At the Alpine mine near Washington ranch a tunnel has been run on the ledge for a distance of 140 feet, and a winze sunk to a depth of 35 feet. The ore carries a small quantity of free gold, and is heavily charged with sulphurets. It is being worked on a bond by Franks and Monckton.

At the Culbertson and Strough mine a crosscut tunnel has been driven a distance of 350 feet in solid rock, and it is calculated that the large vein of the mother lode will be tapped about 100 feet farther on. In running this tunnel several small veins have been cut, some of them prospecting well.

The California Exploration Company has a force of sixty men at work enlarging the capacity of the Amador canal. Preparatory work is being done on the proposed electric plant to be erected near Tripp's mill, Amador county, and the contract for building the dynamos has been let.

Chronicle: The mill at the Keystone mine at Railroad has been shut down and the work of sinking the shaft 200 feet deeper has been commenced.

Twelve tons of quartz milled last week from the Sheffield consolidated gold mine, yielded $918, and 5600 pounds shipped to Selby's smelting works gave a net profit over all expenses of $303.

Prospect: At the Royal mine the vein at the 560 foot level has assumed a more upright position, having an angle now of about 45°. The mill is working regularly.

The Mountain King mine has a whim put up and they are hoisting out good milling ore. The vein on top in some places is over 50 feet wide.

A discharge of 900 pounds of powder in the Central Hill gravel mine put off lately thoroughly shook up some 40,000 cubic feet of auriferous gravel.

Tom Peachy is still sinking his Hog Pen mine and the shaft has reached a depth of 15 feet, showing a well-defined vein of ore about 3 feet in width with indications of a permanent lead.

El Dorado.

(Special Correspondence).—A. Bentler is operating in channel mining three miles east of town. The tunnel has reached 800 feet.

R. E. Griffin has been elected president of the Baltic Mining Company. They are erecting a 5-stamp mill.

The tunnel on the Union, one mile east of town, has reached 230 feet. The owners expect to crosscut the ledge within 60 feet. This is an old quartz property being reopened. The surface ground paid richly when worked many years ago.

The shaft on the Amazon, 6 miles north of Placerville, has passed through the old works and is down 60 feet in a 4-foot solid ledge.

Goodwin George of the Baltic mine, has associated himself with L. M. Howard in developing the New Victor quartz mine on Slate mountain, 16 miles northeast of town.

The New Victor Gold Mining and Milling Company has been incorporated. The officers and directors are as follows: L. M. Howard of San Francisco, president; E. J. Parrish, San Jose, vice-president; Edw. Tyler of San Jose, treasurer; Chas. E. Smith, San Jose, secretary; Thos. Rogers of Mountain View, Mrs. Martha Oldham of Gilroy, and Mrs. D. Keller of Watsonville. The capital stock is $60,000. The work done on this property is a tunnel 350 feet on a ledge that runs from 14 inches to 5 feet. Out of 45 samples the average mill test yielded $10.86 per ton, and the sulphurets $499.32.

The Blanchard Mining Company has 90 feet of shaft and 80 feet of drift on a large ledge that has not been crosscut at yet. The company is composed of John R. Brown of San Francisco, and the following people from Antioch: J. C. Rouse, A. C. Hartly, J. P. Abbot, John Trengove and R. Harkinson. J. R. Brown is manager and John Trengove is superintendent. A new steam hoist is in operation.

Placerville, Sept. 7, '96.

Mariposa.

(Special Correspondence).—The Merced Gold Mining Company's mill at the Potosi has stopped running and the company is confining itself to deeper sinking at several of the shafts. This week some additional men were put to work, and, except that the mill is temporarily shut down, development work is proceeding much as usual.

William Johns, general manager of the Sierra Buttes Company, Limited, has been visiting that company's Tendron mine at Whitlocks, accompanied by his son. The installation of an electrical power distributing plant above Benton mills, on the Merced river, will be of the greatest importance to the Tendron mine. This is a large proposition that is entirely dependent on cheap power.

The Tyro mine is running on very high-grade ore from the 700-foot level. Exact returns are not given, but it is understood that the rock is going considerably over $20 to the ton, and the mill is running night and day, with every prospect of a continuance for a long time to come.

At the Mariposa Grant strangers come and go, and with each important-looking visitor rumors of renewed working are revived. John D. Ludwig, the superintendent, has returned after a protracted visit to the East and elsewhere. He appears to know no more of future movements than anyone on the outside.

Sheriff R. A. Prouty has bonded his ranch near Haywards, some 2000 odd acres, to W. J. Gwynn of London and San Francisco. This ranch (patented) contains bodies of quartz croppings that have never yet been properly prospected. Under the terms of the bond, 90 days are allowed for a systematic inspection, after which work must commence.

Near the Prouty ranch is the Denver mine, operated by Sellick & Co., of Chicago, under the principal superintendence of J. F. Clapp, a mining expert. Prospecting and development work has so far advanced upon this property that machinery for revenue purposes is about being erected. It is as a result of operations at the Denver mine that buyers have come into the field for the Prouty ranch, which has been a sheep run for the past generation.

The most important matter affecting Mariposa at present is the new electrical power plant on the Merced river, above Benton Mills, the promoters of which are Capt. A. H. Ward and Chas. T. Lindner. The water power is to be derived from the Broadhead old dam and carried by a ditch and flume about eight miles. Civil Engineer G. F. Allardt and a corps of surveyors have just completed all the preliminary work and returned to San Francisco. Mr. Allardt's report is entirely satisfactory. Some work continues to be done on the ditch and flume for the present, but it is intended that the matter will shortly be taken in hand by a large, incorporated company.

At Pino Blanco little work is being done. Capt. A. H. Ward was here for a few days recently, but returned to San Francisco on his way to New York. It is understood that his visit to the East is in connection with the Pino Blanco and the electrical works on the Merced river.

At the Laura La Grande mine, above Coulterville, ore running as high as $50 to the ton continues to be crushed. It is very easily mined, and the owners—Messrs. Macfarlane and Duncan—appear to have a perfect little bonanza. They are doubling their crushing plant.

In the same district the old Campadonico mine is being reopened under the charge of James Kennedy. Half a dozen men are at work retimbering and cleaning out, and the mine will soon be in full working order. When worked with an arrastra in olden days, the yield from this mine was large, although the vein was small.

Coulterville, Sept. 8, '96.

Miner: Col. Haskell, who has bonded the Little Wonder mine at Big Oak Flat, has contracted for 30,000 feet of lumber now being delivered and office buildings are being erected. The new 5-stamp mill will be running shortly.

Gazette: On Mariposa creek about four miles below the Francis mine, Hall, Howard & Co., of Merced, have opened a new mining property. They have completed a 5-stamp mill and started to crush ore.

Nevada.

Tidings: The Lamarque mine, south of Grass Valley, has been examined by representatives of an English company, who also looked at other property in the vicinity.

Telegraph: In the W. Y. O. D. mine above the 12-level there is considerable work now being done and in the 11-level and above that there is rich ore.

Union: It is reported that a rich ledge has been struck in the Old Home mine near Blue Tent and that the shoot is an extensive one.

Placer.

Colfax *Sentinel*: At the Mayflower mine last week 3½ feet of gravel was struck at a point 125 feet up the incline they are now running. A survey for hydraulicking has been completed. The company expects to impound debris in Black Oak canyon.

The Redstone mine, near Blue Canyon, has closed for a time.

Plumas.

National-Bulletin: The Genesee mine is closed down and rapidly filling with water. E. Kelsey is erecting an arrastra where the mill stood.

San Diego.

Jesse R. Grant and others have incorporated for the purpose of working the Ballena placer mines near Julian. The owners, Bailey, Sawday, Jacoby, Harritt, Fisher and others, have done considerable development work, principally in the construction of ditch and tunnel.

The Hubbard mine has opened up.

The Owens mine has good chutes of rock in both drifts.

Robert Gardiner will resume work on his Blue hill property soon.

Some rich quartz was struck in the Gold King mine lately.

F. Holland, of the Elevada, has started a tunnel to crosscut for the ledge.

Shasta.

Courier: At Hetchel's mine near Whisky Creek the six small ledges appear to be gradually converging to a point, and the indications are that they will terminate in one main ledge.

Free Press: At Cinnabar, O'Shay and others are meeting with good results at the "Boulders," the new discovery. Shafts are being sunk and tunnels run.

The Ellery brothers have bonded their mine near French Gulch for $40,000.

The Peerless Hydraulic Mining Company at Muletown have about two miles of the ditch completed. There yet remains seven and one-half miles to be constructed.

Siskiyou.

Reporter: The Gumboot mine is at a depth of 85 feet. A new tunnel is now under way to tap the lode a 100 feet deeper.

The Columbia mine on Old Baldy is producing good ore and the mill is running at its full capacity. Over twenty men are employed.

The Mabel mine has a great deal of good ore on the dump. This mine joins the Columbia on the east, and is an extension of the same lode. They are at present erecting a 5-stamp mill on Mill creek, below the Columbia mill.

It is reported that work will soon begin on the Quartz Hill mine.

Journal: The big French creek ledge, about seven miles from Etna, is to be opened up again soon. The 5-stamp mill at that ledge is to be increased five stamps. This ledge is one of the largest in the county.

The French company, which owns the mine in the Wild Cat country, on South Fork, will soon commence work with a large force of men. They will build an eight mile ditch. The same men are interested in this enterprise that own the big hydraulic mine in Trinity county.

Bart Shelly struck a ledge on Cherry creek lately, which is composed mostly of silver ore, but containing gold as well.

Journal: George A. Warder has put up a 2-stamp mill at the Crowley mine on the south fork of Scott river for the purpose of prospecting. The ore is of low grade, but the ledge is very large, ranging from 10 to 20 feet in width. It was lately purchased by Mr. Warder, who intends doing considerable development work, with a view of putting up an extensive mill if the quartz improves to justify the cost.

The Distlehorst and Barton Klamath river dredger is said to be a pronounced success. It is not known exactly what the result has been, but from all that can be learned, it is certain the result has been far beyond the expectation of the owners of the dredge.

The Company D mine on Long gulch, formerly the S. and S. mine, is producing some good rock.

The old Montezuma mine, near Callahan's, is paying well this year. It is worked by a company of Chinamen, and a clean-up from from $1500 to $1800 is estimated.

The Nebraska mill is kept in operation most of the time. The rock from the ledge will go better than that taken out in the past.

The Ball mine on Salmon river, which has been closed down for some time, will soon be started up again, as it is thought the differences between the Siskiyou owners and the Eastern owners will soon be settled. The 20-stamp mill at this mine is the largest in Siskiyou, and the mine is perhaps the best in that vicinity.

The placer miners on Salmon river are getting things into shape to run as soon as the rains commence and furnish them with water.

Tuolumne.

Union-Democrat: The owners of the Tanzy pocket mine near Sonora lately took 169½ ounces of gold from a pocket.

At the App the air compressor is in position and will be used soon to supply the machine drills. The mill is kept running steadily on a good grade of ore.

The new hoist and air compressor are being erected at the Dutch.

Independent: Lord Sudley, of England, accompanied by A. L. Pearse, a mining expert, is making an examination of the Alabama.

At the Santa Isabel the 125 H. P. electric plant being erected near No. 1 shaft is nearing completion. As soon as it is turned over work in all three shafts will be resumed.

At the Bellview the preliminary work of preparing to put in water power instead of steam is being carried on. The ore on the lower levels is of higher grade than much that has been worked heretofore.

At the Red Light mine the tunnel is in 212 feet.

At the Rawhide the new chlorination plant of three tons capacity will be ready to fire up in a short while.

Work on the long tunnel to connect the Eagle and Shawmut mine is progressing rapidly. As soon as the work now carried on is completed a new mill will be built.

The new shaft at the Golden Rule is now down 400 feet. When it reaches a depth of 600 feet, levels will be driven and the ore body explored and blocked out.

NEVADA.

Harry N. Morse of San Francisco and some English people in 1882 bought several locations forty-five miles south of Austin, in the Shoshone range, and tried to work them as silver mines; but, after spending considerable money, shut down. Two years ago Morse bought out the interests of his associates and has since been developing the mines. He has opened up 300 feet of ledge from 4 to 8 feet wide that assays from $10 to $30 in free gold and sulphurets and has erected and started up a 10-stamp mill.

The DeLamar Company is determined to find out the depth of the great mine. It is reported that they are about to sink a deep shaft in the No. 10 tunnel, which at present is the lowest workings in the mine. The mills are crushing from 260 to 280 tons of ore daily, and still are not being operated at their full capacity.

The April Fool mill is running very successfully, and 97 per cent of the values of that property's ores are being saved. Recently the company bonded one of its mines—the Jumbo—to parties who are now sinking upon it.

It is reported that Capt. De Lamar has taken an option on the Rose group of gold claims near Tuscarora, Nev.

White Pine *News*: The Clements Bros. have struck a large and rich vein of gold ore on the south side of this town. This property has been traveled over for years, in plain view; but as we have never looked for gold until lately, no one ever took the trouble to prospect it before.

Pioche *Record*: The De Lamar Company is said to be taking its best ore from a large chute developed in Lucky Bar ground, and which pitches toward the southeast. This fact encourages claim owners to the eastward and will result in prospecting, since it is acknowledged that Ferguson district, in the formation of its mineral, directly contradicts, in several important respects, the long cherished opinions of mining men. Chloride of gold in native form, it was asserted not long ago, had never been found; but the bulk of the best ore in Ferguson district is of this character.

State Journal: Capt. W. F. Mills, D. Dickey and others have struck a lead on Granite Hill that is rich in gold and copper. Specimens of the ore show well in gold and carry more or less copper. A shaft has been sunk on the lead to a depth of 18 feet. The lead is about 16 feet wide and the ore streak is 3 feet wide.

Capt. A. D. Griffin has discovered a gold-bearing lead. Several tons of the ore worked $39.50 per ton in gold at the reduction works, with concentrates to hear from. The lead is about twenty-one miles from town, close to the California line.

OREGON.

Bedrock-Democrat: A Seattle syndicate has purchased extensive placer grounds and water rights near Susanville. The ground, including three claims at the mouth of Bear creek, was obtained from Ives Brothers and Richardson. It is intended to take water from Camp creek.

The Clark's creek placers, operated by the French syndicate, have closed down for the season.

Democratic Times: It is reported that work will be resumed shortly at the Illinois River copper mines.

John C. Allen and J. B. Dyar of Talent have purchased the Kneiss mine at Hamburg Bar, on the Klamath, and will operate it this season.

It is reported that A. W. Sturgis has sold his placer mines on Forest creek to Portland parties for a large sum.

E. B. Jennings of Table Rock precinct has bonded several hundred acres of land to A. A. Davis of Medford, who will prospect for coal. There seems to be a valuable deposit in that neighborhood.

BRITISH COLUMBIA.

(Special Correspondence).—The Cariboo and Williams' Creek Gold Extraction Company, Ltd., is successfully working Black Jack ore. Five days in each month are devoted to working any ores, in 5-ton lots or less, at actual cost of treatment. The company is operating the Government reduction works under lease, and the 5-day clause of the contract is reviving quartz mining. Many claims have been staked and several 5-ton lots are to be tested. It seems that quartz development in Cariboo is now fairly in sight. The Discovery Company's ditch, Little Sally Creek, is completed and the property will soon be outfitted.

The Big Sally Creek Company, Wm. Adams, M.P.P., manager, is running a tunnel to tap the deep ground on that creek.

On Stewart creek, emptying into Big Valley, Cockrell, Isaacs, Johnson & Walker have run 250 feet of rock tunnel and are now in gravel paying 2 ounces to the set.

The Cariboo Mining and Development Company, on Wolf creek, a tributary of Antler, are opening a hydraulic mine. Water will soon be taken from Antler creek by seven miles of

ditch. Work on the ditch is well under way.

On Aug. 24th the Waverly Hydraulic Mining Company, Grouse creek, declared dividend No. 1 of $1 per share.

The other hydraulic mines in the vicinity are owned by individuals. They have, almost without exception, paid better than usual.

The Cariboo Gold Fields, Ltd., bed-rock drain, Williams creek, is being advanced about 20 feet per week.

New pipe is being placed on the Eye Opener hydraulic

Bunkerville, B. C., Aug. 28, '96.

Rossland *Miner*: The Heather Belle group has been bonded to a syndicate represented by Mr. Wright, of Weeks & Wright, of this city, and Albert E. Dennison of Toronto. The owners were James Davidson, Alexander and James Mowat, Samuel Forteath and James Burns. The purchase price is stated to be $25,000.

Development work has been started on the Northern Belle, on Red mountain. It was bought in July by W. A. Campbell for himself and some Toronto friends and incorporated in Toronto for $1,000,000.

The Cliff has encountered a good body of ore 5 feet wide, carrying 15 per cent copper, with a good value of gold. The chute is 132 feet long.

The control of the Union Gold Mining Company, Limited, has passed into the hands of the Walters Company, at the rate of $48,000 for the entire capital stock.

John Moynahan has resigned the superintendency of the Le Roi mine and has joined a syndicate composed of W. A. Campbell and P. Burns of Rossland and William McKenzie, in the purchase of the Iron Colt for $40,000 cash.

The Le Roi shaft is now down to the 500-foot level and the bottom of the shaft, 8x14 feet, is in solid, clean ore. The ore is of the highest grade ever encountered in the mine, running from $40 to $500 in gold. There have been explorations with the diamond drill extending 100 feet below the 500-foot level, and these show the ore continuous all the way down.

Five-sixths of the Nancy Hanks has been sold to E. W. Nettleton and California people. A 100-foot tunnel will be commenced at once.

Nelson *Tribune*: The sale of the Montezuma and Mexico has been finally arranged for $20,000.

New Denver *Ledge*: Colonel Jenkins has returned from a trip to Cariboo creek where he obtained a bond on the Promatura for $30,000. The claim is considered one of the best in the district and is opened by a 100-foot tunnel. A sample taken went $80 in gold and silver. The ore is white quartz and carries some iron and copper sulphides.

The Iron Colt, lying between the Iron Horse and Columbia in the Columbia mountains, has been sold to a Toronto syndicate for $40,000.

UTAH.

Tribune: Shipments of ore from Bingham in July aggregated 6151 tons. But for the slump in lead, which has caused a decided falling off during the past two weeks, the shipments for July would have exceeded those of any previous month of the year.

A half interest in the Song Birds at Mercur has been sold by W. S. Fugate to Simen Bamberger for $25,000.

At the Geyser the quality of the ore in the new tunnel above the Marion is improving. The entire cost of mining and milling is now reduced to $1.77 per ton. Assays of the tailings show a loss of only 41 cents.

At Tintic a new tunnel to tap the vein on on the Hamburg has been commenced about 400 feet north of the old one, and will be 500 feet long and tap the vein 125 feet below the the present level.

The North Star Company is grading for a new shaft and will commence sinking in a few days.

In the State Line district the Sulphite has been bonded to a Wisconsin capitalist named Leroux for $50,000, though not a foot of work has been done.

The Elmore mine at Rocky Bar has suspended operations. The rich body of ore found in this mine last spring was soon exhausted, since which time explorations have been made with diamond drills, but without avail. and the managers decided to quit.

Park City *Record*: Owing to the tightness of money the Putnam mine was closed down on September 1st, to await the verdict of the American people regarding the future of silver.

Work has been suspended at the Bogan and the water now has possession of the shaft. All the rumors about pumps being broken and boilers strained are without foundation, the simple truth being that owing to the low price of silver and lead and the general disturbance in the mining industry, it is impossible to sell stock or raise money to carry on a prospecting enterprise.

IDAHO.

In the Pierce City district, on Reed's creek, a company are opening up a large placer claim and have 25 men employed, and will within the next few weeks have their flume work completed and commence washing gravel.

Adjoining this claim another outfit are making arrangements to work over a large body of dirt and are busy with men constructing ditches and a reservoir for a supply of water.

The American Placer Mining Company, on the Oro Fino, after an expense of $30,000, have commenced washing pay dirt.

Inter-Mountain: Idaho is making a record this season in the development of her placer diggings, and if the interest taken in these deposits continues it will not be many years before she will be a formidable rival to California.

On Snake river also placer mining is being engaged in from the Wyoming to the Oregon line, and in various portions of the State a number of placers are being operated with encouraging results.

The Bingham Placer Mining Company is letting a contract for the construction of a 3½-mile flume and ditch, and the erection of a complete hydraulic plant on its placer deposits in Lemhi county; while in the same county, in Prairie Basin, Judge C. W. Stayner and John Buck are putting in a plant.

World: The Elmira, at Banner, will do nothing more until there is an advance in the price of silver. When running full force this company employs about 200 men.

Avalanche: The Old Glory Mining and Smelting Company now has the Henrietta mine at Wagontown, and is pumping it out and putting it in shape for production.

The Ozark mine's new mill at Florence has been started up. The Gold Bug mine has struck a rich ledge and will put in a 10-stamp mill at once.

MONTANA.

Operators of the Young & Brickley placer claims, located about fifty miles northwest of Missoula, picked up a nugget valued at $120.50 lately. The properties are now under option for $5,000.

A body of ore has been struck in the Cook mine, near Virginia City. It is 7 feet wide and is said to be rich. The company have about 1500 tons of ore on the dump, and are considering the advisability of erecting a mill.

There has been discovered another rich placer section in Granite county; it is located near the famous Quartz gulch, in Montgomery Gulch.

Butte *Miner*: At Saltese, the lease held by W. L. Leadford on the copper water flowing from the St. Lawrence mine has expired, and the Anaconda Company has refused to renew the lease. Leadford has made a fortune out of his contract; his profits are said to have amounted to about $8000 per month. The water from the mine was turned into vats in which old iron, tin cans and other metal refuse was thrown, and the copper thus precipitated, a mine of wealth was opened up. According to his contract with the Anaconda Company, he turned over to the company 25 per cent of the profits of his enterprise, which left him a handsome margin of profit, with no capital invested except a lot of old iron. Some time ago the company went into the business of saving the copper from the water before it left the mine, by using up old iron, thus weakening the water. A suit was the result, as Leadford claimed that this was an infringement on his lease. He applied for an injunction against the company, but it was refused. The process was discovered by accident by a man who threw some old tin cans into the stream as it flowed down the hillside. Leadford was lucky enough to get a lease from the company for two years. Fires on the lower levels of the St. Lawrence are said to be the cause of giving the waters the peculiar properties which make it so valuable.

The Twilight has again resumed operations on a large scale and is now paying handsomely. The Twilight is in the Flint Creek district, a short distance from the Flint Creek mine.

Clancy *Miner*: The Copper Jack, on Warm Springs creek, above Alhambra, is reported to have been sold to a Helena syndicate.

The old L. Wattricle Mining Company of Marysville has been revived. This company owns five claims, all of which have been more or less developed; one is the extension of the Drum Lummon, which has paid its English shareholders over $10,000,000 in dividends. The Drum Lummon is now 1800 feet deep and the deeper the richer the ore becomes.

The development of Jerome creek, 25 miles east of Palouse, is proving satisfactory to its owners. While as yet but three properties in the district are being opened to any extent, there are 22 discoveries which are known to prospect with mortar and pestle.

Inter-Mountain: Camp Creek is now a deserted village, and only three or four men now remain in the once lively mining camp. The machinery on the Anaconda properties has been removed and the hoist on the Clipper has been sealed up, probably not to be opened again for long years. On Corral gulch work has also been practically suspended since the Montana Ore Purchasing Company shut down the Maggie.

Articles of incorporation of the Black Placer Company have been filed in Butte.

At the Anaconda properties the foundation for the big engine at the Never Sweat is about completed and is now enclosed by the framework of the hoist. At the St. Lawrence sinking is still in progress. On the south side of the hoist a dozen or more workmen are engaged in excavating for the foundation of the mammoth engine which will replace the present one. At the High Ore No. 2 the shaft has now reached a depth of over 1400 feet. Several sections have been cut, but no drifts have been run, and it is likely will not until the shaft reaches a depth of at least 2000 feet. It is the intention of the company, it is understood, to continue sinking until a depth of 4000 feet is attained. It is predicted that the Anaconda Company will be able to double its output of copper ore by next year.

SOUTH DAKOTA.

Black Hills *Miner*: The owners of the Rua group of claims, adjoining the Gushurst property, have leased fifteen of their claims to Rua Bros. & Co., who are enlarging the old workings and will work the property in a systematic manner.

In drifting from the main slope the Hawkeye Mining Company have opened up a new body of cement ore that yields a good prospect by pan and mortar test. The ore is an oxidized conglomerate, altogether different from the other cement ore in the property, which is non-oxidized and of a grayish color.

The ore shoot opened on the Kickapoo lode, situated south of the Wasp No. 3 property, is proving to be a bonanza. The tunnel has been driven into it for 12 feet, at which point it is 6 feet thick. An average sample taken from the face recently assayed $112 gold per ton.

Siliceous ore averaging $75 per ton in gold has been discovered within the city limits of Deadwood, and promises to develop into a most valuable thing. The ore lies in the limestone, in vertical formation, identical with the formation at Ragged Top, where such rich ore has recently been discovered. The discovery is near the smelter, where its possessions aggregate 700 acres of ground lying east and north of the smelter.

WYOMING.

T. Sun and C. O'Conner have sold to E. A. Greene, of New York, 3000 acres of gold placer ground at Oregon Buttes, in South Pass district. The purchase price is given out as $150,000.

At Laramie some fine samples of mica have lately been received at the Mining Exchange. One is from near Laramie peak. It is perfectly free from iron stains, has a good cleavage and the sender states that sheets 12x12 are easily obtained. Another sample is from near Battle lake, in Carbon county, and is similar in all respects to the above.

The Exchange is also in receipt of some samples of asbestos from the vicinity of Battle lake that are superior to any yet discovered in the State. The owners of both the mica and asbestos in Carbon county report that arrangements have already been made for the development of the property and the disposal of the products to eastern parties.

It is reported that Mr. Douglass recently purchased a mill for his property on Sandstone creek in the Savary district in Carbon county. This property consists of ten claims. The principal work has been done on the Northern Belle. The company have run a tunnel in on this property a distance of 240 feet, where the ore body is 4½ feet wide and an average of assays made gives $10 gold per ton.

The Lone Tree mine, owned by A. W. Hayward at Granite canyon, has just been sold to an eastern syndicate who have already commenced to work it. At a depth of 40 feet the ore body is 4 feet wide and shows by fire assay from $35 to $40 per ton gold.

A vein of gold-bearing quartz has been struck in the Big Jim shaft at a depth of 50 feet. This property is but a few yards from the Lone Tree and is owned by the same syndicate.

COLORADO.

At Gunnison a five-foot vein of good looking ore has been cut in the Dubois tunnel, which is being driven by the Dubois Tunnel Company. This find was made at 350 feet depth.

At the placer mines at Madera station, three men are at work making good wages with common gold pans. This placer is on the Lake fork of the Gunnison river, thirteen miles from the mouth of the stream.

Victor *News*: In the May Belle at Lawrence the tunnel is 225 feet from the mouth, and in the breast between granite walls, a vein was encountered, which, it is stated, is 11 feet in width and assays run from $188 to $60,000 a ton.

The Baldwin tunnel will resume active operations in a few days.

The August output of the Anchoria-Leland Company approximated $40,000, after hauling and smelting charges were paid. This is about $5,000 over last month's figures. The manager is confident that in the future the mine will ship at least $50,000 per month net for the balance of the year.

Denver *Republican*: At Cripple Creek J. E. Phillips has sold the major portion of his holding in the Cripple Creek Gold Exploration Company to a French syndicate and retired from the active management of the property. About a year ago he formulated a company and interested Colorado Springs people in developing the ground for the exploration of the big vein coming down from the hills. The Exploration Company has been a favorite with Eastern investors, and when the French syndicate made an offer for a large block of the stock Phillips decided to sell and turn his attention to his other enterprises.

The Findlinger lease on the Mountain Monarch of the Gold Standard is turning out some high-grade ore from a winze sunk from the tunnel level. Assays had on sylvanite rock taken from the working ran close to $1000 a ton, and the strike is fulfilling the expectations it excited when first made a few days ago.

One of the leading ore haulers of the camp states that the output of the camp last week was the heaviest in its history, and the statement is borne out by the sampling and railroad men.

The Goodwill tunnel, starting from Cottontail gulch, between the two railroad tracks, is headed for the heart of Gold hill and intended to cut the Anchoria Leland main vein at a point 676 feet below the collar of the main working shaft in a mean length of 3000 feet. The tunnel is to be run primarily for drainage and transportation, and the company are to erect mills for the reduction of low-grade ores; to develop electric power for lighting, etc., by the waste drainage water. The tunnel will develop the veins at a depth of from 500 to 900 feet. No stock of the company is for sale on the market, the stockholders being W. P. Bonbright & Co. and their clients in France and Belgium, and also Messrs. Helm, Weston, Howbert, Parsons, Shields and Blackburn. The working capital has been subscribed, and as soon as the money arrives here, which will probably be in four or five days, the machinery will be ordered and work commenced.

The Independence mine is producing an immense amount of smelting ore from lower levels, and without touching the reserve above tide line or low grade zone. The output for the past week has averaged seventy-five tons a day.

News comes from Loveland that a 3-foot vein of pay ore has been cut in the Long View tunnel at Camp Carter, which has caused considerable excitement in camp.

At Ward the new stamp mill on the Montgomery group of mines, owned by members of the Schlitz Brewing Company of Milwaukee, Wis., has been started up.

The Unita Company intends putting a large hoisting plant, formerly used on the Unita, on the Baxter mine. They will also put a pump on the Boston mine and take out the water, and get both mines in shape for work.

About 120 tons of good ore is now put through the Modoc mill daily, ten additional stamps having just been put in.

Sayward, Woolching and Koch of Denver have started to develop the Chatam mine. About ten months will be devoted to exploration work.

Drifts were started this week from the 90 foot shaft of the Gold King mine and a big pile of good milling and smelting ore is being taken out. The owners intend putting up a new shaft house and steam hoisting plant soon.

The Cleveland owners of the Sun and Moon group of mines at Idaho Springs in the levels run off at a depth of 16 feet now have ore 42 inches in width, it carrying lead and copper of a smelting value. To the east the streak is also coming in and lying by the side of ore carrying gold values, a test returned 20 92-100 ounces gold per ton

California representatives were in Ward during the week looking over the district with a view of investing. They offered $25,000 for the Lord Byron, $5000 cash in hand and the balance in sixty days. The offer was refused.

In extending the levels eastward into practically virgin ground, some large bodies of mineral have been opened up at the Albro property.

In the Pine creek district the Gold Standard property is to be opened up again. Mr. Zehrung of Colorado Springs has obtained a lease and bond on the property and is backed by parties interested in the Ironclad property of Cripple Creek. The Gold Standard property has been worked more extensively than any other in the district, but owing to difficulties among the stockholders, it was closed down towards the end of 1895. There is a large body of medium grade ore in sight.

NEW MEXICO.

Silver City *Enterprise*: The Treasure Mining Company has consummated the purchase of the Atlantic and Deep Down property. The purchase price of the St. Louis interests has been paid in full and a large installment paid upon the Wagner interest.

There has been brought from the Bell & Stevens claim, on the Pacific lode, 300 ounces of gold. The main working shaft, which is now 380 feet deep, is being retimbered and enlarged near the surface, preparatory to sinking for deep working.

ARIZONA.

Journal-Miner: The Co-operative Gold Mining and Milling Company has its mill about completed. This company has put in an extensive pipe line, through which they will obtain a water supply to run an electric dynamo for power to run their machinery. This company's mine is a north extension of the Gold Note mine.

Gov. F. A. Tritle is developing the Monarch, south of Prescott. The ore body has widened out rapidly. The ore averages about $6 per ton in gold, 14 ounces in silver and 20 per cent in copper.

D. B. Gillette has broken all mining records in this county in the development of the Surprise and Gold Note mines on the Black mesa, near Bumblebee. He commenced work on the Surprise mine on June 11th, and on August 24th had run drifts and sunk shafts aggregating in all 521 feet, 6½x4 feet in the clear. On July 14th work was commenced on the Gold Note mine and on August 24th the work done on it in sinking and drifting. In the Gold Note he has twelve feet of good milling ore, while in the drift of the Surprise there is six feet of good ore. It is all free-milling gold ore. Mr. Gillette has also recently purchased the Hercules mine from Geo. Zika and is arranging to place a hoisting plant and pump on it.

Kicker: Among the cyanide plants in the Territory are the following: At Harqua Hala, 160-ton capacity; at Fools' Gulch, of 100 tons; Congress, 80 tons; Wickenbug, two plants of 60 tons each; Seymour, 40 tons; Tombstone, four plants of 10 to 30 tons each, and a number of other plants throughout the Territory on a small scale, from 5 to 15 tons capacity. At El Rio a large plant is now being built and also one at Golden.

Oasis: At Washington Camp the water in the Duquesne mine was pumped out some time since, and the shaft is sinking and drifts are running, good ore coming out from all points.

The Golden Dream Mining Company will put their mill on the Colorado, two miles above Picacho.

SOUTH AFRICA.

South African *Mining Journal*: At the Geldenhuis Deep at the beginning of this year there were 16,500 feet driven, so that to complete the development of 900,000 tons of ore an additional 3500 feet of driving was required, bringing the total to 20,000 feet. This amount of driving cost £140,000, at the rate of £7 a foot, including all underground and general mine expenses and equipment, except cost of main pumps, and being also at the rate of 3s 2d per ton opened. During the first three months to the end of December last only 24,000 tons of ore were crushed. The mill was only working to two-thirds of its natural capacity. When the full stamping power is started such an amount will be nearly accounted for in a single month. The ore is expected to yield about 10 dwts, mill and cyanide together, worth about 35s, while the working expenses are set at 25s for 100 stamps, and at 20s when the 200 stamps shall be running.

The Pioneer has declared in dividends, during this year, a total of 200 per cent to August 1st, the amount having been 50 per cent in February, 75 per cent in March and 75 per cent in June. This is even better than was generally expected when the company last year took over the Tribute mill and cyanide plant, when monthly profits of about £5000, nearly equal to a rate of 300 per cent per annum upon the capital, was confidently expected.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPT. 1, 1896.

566,837—BOILER FURNACE—P. H. Bagley, S. F.
566,734—DRY DOCK—Boggs & Cameron, Portland, Oregon.
567,076—[illegible]NT TRAP—P. H. Brown, Redlands, Cal.
566,895—PUMP—Geo. E. Dow, S. F.
566,903—FISHING BASKET—L. E. Gieschen, Oakland, Cal.
567,092—AIR COMPRESSOR VALVE—R. F. Grigsby, S. F.
567,096—CHAIR—Harvey & Amos, Los Angeles, Cal.
567,101—GATE—J. H. Johnson, Silverton, Or.
566,777—MACHINE FOR MAKING POWDER—J. E. Layng, S. F.
566,775—REGULATOR—W. O. Ludovici, S. F.
566,929—WINDOW SCREEN—O. G. Niehaus, Berkeley, Cal.
567,041—LABELING MACHINE—H. Rawlinson, S. F.
566,873—BOTTLE—W. H. B. Schmied, Napa, Cal.
567,048—WOOD WEDGE—J. H., J. R. & W. E. Smith, Snohomish, Wash.
566,942—BEER FOUNTAIN—W. H. Smyth, Berkeley, Cal.
566,878—CASH REGISTER—E. T. Taylor, Oakland.
566,820—KEY RETAINER—Tucky & Harris, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SINGLE ACTING CRANK PUMP.—George E Dow, San Francisco, Cal. No. 566,895. Dated Sept. 1, 1796. This invention relates to that class of pumps having a number of plungers known as "multiplex plunger pumps." The object of the invention is to provide a system of lubrication combined with automatic means for draining and preventing accumulation of water in the crank case, and maintaining the oil level or surface of the lubricant below the cranks, so that each crank will dip into the same, but so that the pump plunger will not come in contact with the body of lubricating liquid within the case. It consists of a closed crank case adapted to contain a lubricating liquid; a crank shaft with cranks situated within the crank case, plungers reciprocating at an angle above the horizontal and connected with the cranks; suction and discharge chambers with intermediate valve chambers connected with the upper part of the plunger chambers so that a vacuum is produced and the liquid moved through the valve chambers by the reciprocation of the plungers, a pipe connecting with the suction chamber and with the pipe which unites the top and bottom of the pipe case with check valve for the discharge of any surplus; a means for lubricating the plungers and supplying lubricant to the crank case; the suction chambers connecting directly with the pump chambers, but cut off from direct connection with the plunger chambers.

WINDOW SCREEN.—Otto G. Niehaus, West Berkeley, Cal. No. 566,929. Dated Sept. 1, 1896. This invention relates to that class of window screens in which the screen is composed of intersliding sections whereby it may be adjusted in length to be inserted in and fit the aperture or space of the window casing, and to form a proper joint between the sill on which it rests and the lower rail of the sash which is drawn down upon its top. The chief feature of the screen consists of clamps or straps secured rigidly to one of the intersliding sections, one above and one below near the inner corner of one of its ends, each of said straps overlapping the other section and having a down-turned end sliding in a groove in said section, and similar clamps or straps secured rigidly to the other section and overlapping the first-named section, and fitting and sliding in grooves therein. Another feature of the invention consists in stops at one end of each section by which the two sections, when closed, are not only limited but, when opened either fully or partially, are so protected between their screen surfaces as to form a fly-tight joint. Another feature consists in bevelling both the upper and lower sides of both screens, whereby they are enabled to fit the window in any position in which they may be placed.

BOTTLE.—Wenzel Hyronymus B. Schmied, Napa, Cal., assignor of one-half to Henry Brown of same place. No. 566,873. Dated September 1, 1886. This bottle belongs to the class of non-refillable bottles and to that subclass in which provision is made for the necessary destruction of the head or neck of the bottle, or a portion thereof, in order to reach its contents, which destruction subsequently prevents its reuse. The bottle is formed with a neck having separated beads or rims on its exterior, adapting it to be broken in the space between them; a cork is fitted in the neck and traverses the plane of the space between the beads, so that a portion of it projects when the neck is severed; a hard metal disk is fitted on top of the cork to prevent the latter from being driven into the bottle, and a mass of hard material fills the neck above the disk.

FISHING BASKET OR CREEL.—Louis Edgar Gieschen, Oakland, Cal. No. 566,903. Dated Sept. 1, 1896. The object of this invention is to provide a simple, serviceable and convenient device which, while serving all the purposes of a disk, will serve the additional ones of a fly-book and leader-box. These latter purposes are subserved by forming in the cover of the basket receptacles suitable for the objects intended. One of these receptacles is for the leaders and comprises parallel vertically disposed slotted partitions through which the snells are passed and separate compartments at the ends of the main receptacle for flies. There is also provided a central compartment in said receptacle for moisture laden pads, and between these the loops of the snells lie. There is also provided a separate receptacle for the leaders, which said receptacle is furnished with moisture laden pads for keeping the leaders in a moist condition.

Coast Industrial Notes.

—The Los Angeles Oil Exchange has decided to establish a call board with daily morning sessions.

—At an election in Santa Barbara on Monday last it was decided to issue $60,000 bonds to supply the city with a salt water plant and to pipe water to Cold Stream canyon.

—Surveys are being made for an extension of the O. R. & N. road from Dayton. It is said to be the intention to build east to the Covello wheat district in Washington.

—The Common Council of San Jose has granted the Alum Rock and San Jose Railway Company permission to extend its track into the camping grounds of the Alum Rock park.

—The rolling stock of the Valley road for passenger traffic has arrived at Stockton but there is delay about putting it on until arrangements for the terminal property at Fresno are finally settled.

—The people interested in the proposition to build an electric railway through Sonoma and Napa counties from Embarcadero through Santa Rosa, Bodega, Knights valley, Calistoga and Napa valley to Sonoma want a guarantee of patronage, which they are securing in the shape of subscriptions to commutation tickets.

—In Eureka, Humboldt county, the Bear Harbor & Eel River Railroad Company has been incorporated with a capital of $200,000, of which $100,000 has been subscribed. It is proposed to build from Bear Harbor in a northerly direction for about fifteen miles to a place to be decided on hereafter. It will be devoted to the hauling of lumber at first but later on the company will probably engage in general freight and passenger traffic. The directors are E. J. Dodge, J. Hunter, T. Pollard, C. Stewart and A. B. Cooper.

—The Mariposa Electrical Company was incorporated Monday with a capital stock of $1,000,000 in 100,000 shares at $10. All the stock is subscribed by the incorporators, A. H. Ward, G. Ecker, C. T. Lindener, W. B. Taylor and H. C. Ward. The company proposes to erect an electric light and power plant opposite the old Benton mills on the Merced river, in Mariposa county, to which the water necessary will be conducted from the old Broadhead dam. It is stated that they will ask for bids for the erection of the plant which will cost $300,000, in a few days. The object of the company will be to supply power and light to the mines in the neighborhood.

Personal.

WILLIAM RULE has been appointed superintendent of the Mayflower mine at Forest Hill.

PROF. JOSEPH LECONTE is in Liverpool attending the meeting of the British Society for the Advancement of Science.

HANK SMITH, who was a superintendent on the Comstock many years, has been placed in charge of the Centennial-Eureka, in the Tintic district, Utah.

THOMAS N. WILLIAMS, formerly of the New Almaden mines, has been appointed superintendent of the Altoona quicksilver mine at Cinnabar, Trinity county.

OF the Californians who are away from home and have made reputations in the mining world, Hamilton Smith, who has been for several months in America, is at the head of the Exploration Company of London, which is generally supposed to have the backing and confidence of the Rothschilds. John Hays Hammond is consulting engineer in London for the Chartered Company of South Africa, which controls principalities and millions. Gardiner F. Williams, who is at present in California, is the general manager of the De Beers diamond mines at Kimberley, the largest mines of that kind in the world. H. C. Perkins has been in charge of the Rand Mines, Limited, at Johannesburg, where he has been sinking some deep level shafts, which, with their equipments, will cost $20,000,000. He has made a fortune and desires to retire from that work. He is now in London. Henry Janin resides near London and continues to interest himself it mining matters. H. H. Webb is in Johannesburg as consulting engineer for the Chartered Company, succeeding John Hays Hammond there. L. Gilson is in London connected with the management of the Exploration Company. William F. St. Auburn has returned from Matabeleland and gone to New Zealand to examine properties for a London syndicate. Capt. Thomas Mein sailed from London on the 5th. He will not return to Africa, having made a fortune, but will interest himself in California mines. J. B. Hobson is in charge of hydraulic mines in Cariboo, B.C. Joseph McGillivray is opening up mines in Spain for a Paris syndicate. Louis Janin, Jr. lately placed an Australian mine in London, where he is now making his headquarters. Charles Butters is still in Africa, where he has made a name in developing advanced methods in working ores.

Obituary.

NELSON WESCOTT, a mining engineer, who came to California in 1853, died at the age of seventy-five in Santa Rosa last Monday.

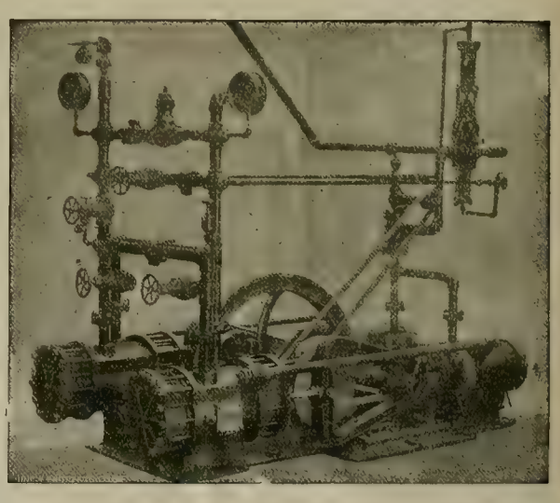
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

PAYNE'S PATENTED GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,
1710 Champa Street, DENVER, COLORADO.
☞Woul sell an interest to right party.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Send for Catalogue and Price List.

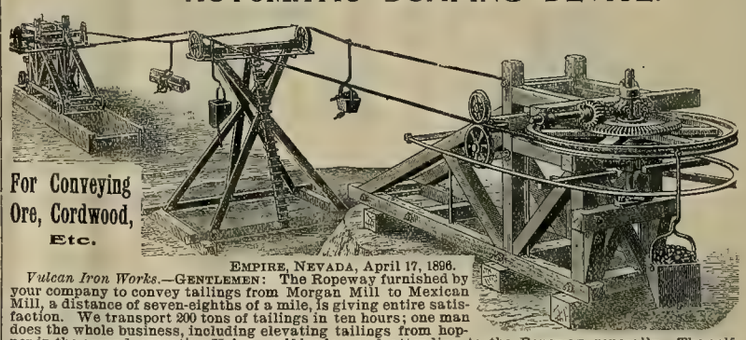
VULCAN ROPEWAY

— WITH —

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 10, 1896.

Business holds up remarkably well. The bulk of orders are coming to hand from mining camps and more distant points. This demand seems to be the advance movement in winter stock buying. The trade looks for an increase of at least 33⅓ per cent in the buying for winter stocks over that in 1895. From the agricultural districts the demand continues free. If we have an early rainy season, which many look for, there will be good buying from the agricultural districts well into the winter. With manufactures and iron workers in general there is continued activity, with some new orders secured the past week.

Although the supply of gold coin held by banks has increased to a very considerable extent, yet the local money market works close. The withdrawals from banks have about ceased, and no further trouble is looked for in that direction. Merchants report that remittances are free from all sections of the State, but with the retail trade buying is in as small quantities as possible. This applies to retail merchants who are not compelled to carry much of an increase in their stock during the winter months. It is thought that after election the money market will show more general ease. The money markets at the East are gradually working easier. The heavy imports of gold from Europe have had a beneficial effect, as has an active and higher market for railroad and industrial securities. The close money markets compelled wheat growers in the great grain growing States to sell their wheat so as to pay their debts. This has helped collections and tended to ease the money markets.

New York Silver Prices.

NEW YORK, Sept. 10.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	30⅝	66¼
Saturday	30⅝	66¼
Monday*	....	....
Tuesday	30⅝	66¼
Wednesday	30½	66¼
Thursday	30½	66

*Holiday.

	Copper.	Lead.	Iron.	Tin.
Friday	10 65	2 70	10 25@12 50	13 30
Saturday	10 65	2 65	10 25@12 50	13 30
Monday*	....	....	....@....	....
Tuesday	10 65	2 75	10 15@12 50	13 25
Wednesday	10 65	2 75	10 15@12 50	13 25

*Holiday.

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	Par
New York Telegraphic Transfer	Par
London Bankers' 60 days	$486
London Merchants	$4.85
London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	66¼
Mexican Dollars	51½c

Eastern exchanges are nominal.

SILVER.—For over one week or up to Tuesday the price of silver did not change either at the East or in Europe. This is something unusual and therefore causes remarks. Although the close is weak and lower the impression prevails that the selling pressure in America has relaxed and that large dealers and speculators are only waiting election developments in this country before doing more business. The demand for the Orient is light. From this port no silver was exported to Japan in August but China took $274,371 worth.

Pixley & Abell of London report shipments of silver to India, China and the Straits for the year 1896 to September 1st, as follows, as compared with the corresponding period of 1895:

	India.	China.	Straits.	Total.
1896	£2,400,278	£574,413	£545,686	£3,520,377
1895	2,410,880	1,175,767	541,503	4,128,150

MEXICAN DOLLARS.—The demand is light and market easy, with the supply liberal. There were 156,898 dollars exported to China in August.

COPPER.—Business continues light. The markets at the East did not change the past week, so far as quotations are concerned. The New York market is reported by mail advices: New business for foreign account has been very light, to all accounts, and orders from abroad are light at present, with bids higher than the basis of 10½c for Lake Superior ingot strictly the exception. Home consumers continue to buy in strictly hand-to-mouth way and apparently appear wholly indifferent about the future of the market. In the London market prices have ruled somewhat lower and merchant bars were down to £46 17s 6d at the close; speculation there has moderated considerably, but most accounts have it that European consumption continues heavy.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

QUICKSILVER.—The market is steady. The exports by sea in August were in flasks, as follows: To Mexico, 195; Central America, 115; British Columbia, 6; New Zealand, 10. The exports from January 1 to September 1 were, in 1896, 9869 against 8304 in 1895.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export quotations are nominal, but less than for home.

LEAD.—There is nothing new to report. The markets at home and abroad are firmer owing to an improved inquiry and lessening supplies.

Our market is quoted as follows:

Pig	—	@	3 60
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—Demand shows a steady increase.

Drop, sizes smaller than B, per bag of 25 lbs			$1 20
Drop, B and larger sizes,	"	"	1 45
Buck, Balls and Chilled, do,	"	"	1 45

TIN.—There is a light demand. The market is barely steady for both pig and plate. At the East the markets are reported slow and in buyers' favor.

The market is quoted as follows in jobbing lots:

Pig, per lb			14
Plate, I C coke, heavy, per box	$4 10	@	—
" " " light, "	4 00	@	—

ANTIMONY.—The demand is fair, with the market steady at 7¾@8½c in a jobbing way. New York mail advices quote 7⅞ for Cookson's, 6½c for Hallett's and 6½c for Japanese, from store.

BORAX.—There is nothing new to report. The market is quoted as follows:

Refined, in car lots	6⅜
Refined, in sacks	5⅝
Powdered, in car lots	5¼
Concentrated, "	5⅝

POWDER.—The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" " No. 2, " "	8½c

IRON.—The local consumption continues fairly free. A New York exchange says: "It is rumored that the certain interests not wholly unknown in quarters where statistics of metals are handled, have a great scheme in hand to promote speculation in American pig iron warrants at prices lower than those at which cash buyers can purchase actual iron. Confirmation of this was wanting, but that effort is under way to arouse speculation is morally certain."

Our market is quoted as follows:

	To Arrive.	Spot.
AMERICAN.		
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00
ENGLISH.		
Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50

Bolt.....¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing..... 20

COAL.—The demand is essentially unchanged. The market is in buyers' favor for all kinds except English, which are held fairly steady.

COKE.—The market is quoted as follows:

Gas Companies'	—	—	— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—The demand is dull for home and fair for export.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is barely steady.

The market is quoted as follows:

Wire, carloads, basis per keg			$3 20
" jobbing, " "			3 30
Cut, carloads, " "			2 95
" jobbing, " "			3 05

Mining Share Market.

SAN FRANCISCO, Sept. 10, 1896.

The market has been fairly dull and active by turns with the middle shares the leaders. The most pronounced advance was made by Chollar and Hale & Norcross. The former sold up to $2.45 and the latter to $1.55. This move is said to have been made chiefly by a few short sellers filling assisted by some outsiders going long. After these purchasers a raid was made on the Gold Hill shares causing Confidence to decline to $1.40 against sales at $1.65 on Friday. In the decline the entire list sympathized, going off from 5 to 15 per cent At the lower prices strong buying orders came in for the north end shares which steadied the market only to weaken again on Tuesday under a bear raid and some realizing by the longs. During the recent depresssion, the manipulators are said to have secured a large line of shares and it is but natural they should try and market them at an advance, but whether they can do so before election remains to be seen. From an outside point of view it would seem as if the times are against a successful deal unless it is the intention to make a small upmove on reported ore strikes and new work started in two or more of the mines. There can be no doubt that the money market is working close, and it is stated that only one bank gives accommodations to brokers to the extent which obtained some months ago. A close money market is always against a deal. There is another thing against it, viz.: an exciting presidential election and also the general public having lost heavily by dealing on the long side, will be slow to come in particularly moneyed outsiders. While saying this it must be conceded that the work going on in the mines on the Brunswick lode and several of them on the Comstock lode, is of quite an important and interesting character. From its nature one or more strikes of ore are liable to be made any day and as shares are said to be scarce, owing to so many having been paid and drawn out of the market, a quick upmove would result, to be followed by the usual slump unless there should be a sustaining moneyed power in the market, which there does not appear to be.

The following mining companies report having had money on hand Sept. 1, 1896, as per sworn statements filed in their offices this morning: Alta $2858.54, Andes $5719.98, Alpha Consolidated $359.17, Belcher $2871.96, Best & Belcher $18,220.44, Bodie Consolidated $1192.65, besides the bullion product of the mine for August to be received, Bulwer Consolidated $6224.61, besides bullion to be received, Bullion $1484.91, Caledonia $4301.65, Con. California and Virginia $7842.09, besides unsold bullion of the assay value of $42,885.93 at the Carson Mint, Confidence $1169.97, Church $8404.60, Chollar $20,296.95, Con. Imperial $3885.07, Challenge Consolidated $359.29, Con. New York $1587.12, Crown Point $1587.12, Exchequer $1664.33, Hale & Norcross $2312.53, Julia Consolidated $113.94, Mexican $7320.31, Mono $2129.32, Ophir 20 cents, with an assessment of 25 cents per share being collected, Overman $7594.65, Potosi $3994.36, Savage $5508.42, Sierra Nevada $1694.25, Silver Hill $1026.45, Silver King $1727.84, Standard Con. $21,507.45, Syndicate $653.37, Union Con. $2093.51, Utah Con. $847.86.

The following mining companies report having had an indebtedness Sept. 1, 1896: Gould & Curry $154.13, Lady Washington $146, Occidental Con. $1710.13.

From the Comstock mines our advices, as a whole, are of a more encouraging character, but experience teaches caution and not to place too much confidence in favorable prospects. For several years good news and work in the right direction have been followed by dismal failures, low prices and the public holding the shares and the insiders the coin. It is to be sincerely hoped that the present favorable conditions at the mines will prove an exception to what has been for several years past, and that one or more bodies of ore will be found. In the north end mines they are running a north drift and an east crosscrift on the 900-foot level. In Utah they are driving a west crossdrift from the south drift run from the old west tunnel. In Andes they are working on the 450-foot level. In Sierra Nevada they are running a north drift from the Layton tunnel workings. In Mexican they are driving ahead on a north drift from the west crossdrift on the 1000-foot level. In Ophir there is an improvement in the west crossdrift on the 1000-foot level, with a slight seepage of water coming in. They are also working west on the old Central tunnel level. Advices from Con. Virginia are of a hopeful character, but the work on the 1000-foot and 1650-foot levels is largely a gamble, with the chances against finding a large body of good ore. They raised from the 1750-foot level 165 tons of ore, assaying over $45 a ton by car sample. The ore milled by the company shows careful treatment, which gave a good percentage, but everyone expects to find honesty with the Con. Virginia people. In Best & Belcher and Gould & Curry they are still driving the east joint crossdrift from the Bonner shaft. From Savage the news is the same as heretofore made public. In Hale & Norcross there is an improvement in the ore streak found on the 900-foot level. They are still working on the 450-foot level in Chollar. They raised last week 102 tons of ore and milled 360 tons. In Potosi they are working on the 450-foot level. The long west crossdrift in Bullion is being driven slowly ahead.

From the Brunswick lode our advices are to the effect that in Occidental they are working on the same levels reported last week, and that the ore in the winze below the 750-foot level is 2 feet wide and the vein looks well. In Chollar, they are raising from the 200-foot level towards the Potosi line for surface connection, so as to get ventilation. They made a 50-feet drive the past week; this is fast work. On the 300-foot level they are still pushing the south drift ahead. In Hale & Norcross they are ready to start the south drift on the 400-foot level. They will have to run it over 100 feet before they get to the Chollar line. If they find more ore in Hale & Norcross on this level than was found on the 300-foot level, the shares ought to show considerable life. They are running an east crossdrift on the 300-foot level. In Gould & Curry, Best & Belcher and Con. Virginia the work is essentially unchanged.

The market opened this morning dull and fairly steady. After call there was a slight advance, which was followed by lower prices. The trading public are bearish and sell on every little up. The south drift on the 400-foot level of Hale & Norcross was commenced today. By October 1st they will be up to the Chollar line, when the drift will be taken up by the latter company. Usually well-informed miners are watching with considerable interest the work on the Comstock lode that is being done by Con. Virginia, Chollar and Hale & Norcross. The former company will run for the old "burnt ground" now that the gas is said to be out. Official letters from the Gold Hill mines filed to-day do not give any different news from what was published in this department last week. The official letter from Savage is long, but does not give anything new. From the Bodie mines the news is of the same character reported last week. The work in the mines in this district is being closely watched by mining men.

The following illustrates the changes of the week:

ONE KNOWLES VERTICAL SINKING PUMP.

Capacity, 12,000 gallons per hour; in perfect order. Will sell at half price. Address

P. ODERMATT, Boiler Works,

58 & 60 Bluxome Street, San Francisco.

FOR SALE CHEAP.

8x12 Wheeler Rock Crusher; 10 H. P. Ames Portable Engine; 5 H. P. Upright Boiler and Engine. All in Perfect Order.

RILEY, 1202 Mission Street, San Francisco.

Recent California Mining Incorporations.

New Victor Gold Mining and Milling Company, San Francisco; L. M. Howard, San Francisco; E. J. Parrish, E. Tyler, C. E. Smith, Thomas Rogers, Mountain View; Mrs. M. Oldham, Gilroy; Mrs. D. Keller, Watsonville; capital stock $100,000.

The Marble Creek Placer Mining Company; A. Burnbrazer, G. Burbeck, A. M. Benham, S. L. Potter, W. G. Hawkett, J. S. Anderson and R. B. Snell; capital stock $100,000, all subscribed.

Golden Ancient Channel Mining Company, San Jose; F. J. Smith, J. M Haskins and P. C. Smith, Evergreen; T. A. Rogers, Mountain View; R. Fisk, Edenvale; J. H. Challen, Spanish Ranch; G. H. Salisbury, San Jose; capital stock $100,000.

Junction Mining Company, San Francisco; W. H. Storms, C. G. Yale, H. S. Durden, W. A. Hall and R. S. Clark; capital stock $100,000.

Recently Declared Mining Dividends.

Morning Star Mining Company, Colfax, Cal., $5 per share. Payable Sept. 1.

The Jackson Mining Company of Eureka District, Nevada, 10 cents per share. Payable immediately.

The Aetna Consolidated Quicksilver Mining Company of California, 10 cents per share, amounting to $10,000. Payable Sept. 10th.

Mammoth, Utah, $20,000. Payable Sept. 1. A total of $1,110,000 to date.

Silver King, Park City, Utah; $37,000, payable Sept. 7th; a total to date of $787,000.

Calumet & Hecla, Michigan; $500,000, payable Sept. 25th; a total of $2,000,000 this year to date and $46,350,000 since organization.

Commercial Paragraph.

THE Fulton Iron Works are putting in the machinery of a new steamer temporarily named the James Spiers, which has been built for the Inter-Island Steamship Company of Honolulu. She is schooner riggged, 195 feet over all, 34 feet beam and 15 feet deep.

Assessment Notices.

ANCHOR COAL AND DEVELOPMENT COMPANY. Location of principal place of business, San Francisco, California; location of works, Kelso, Cowlitz county, Washington.

Notice is hereby given that at a meeting of the Board of Directors held on the 24th day of August, 1896, an assessment (No. 7) of Three Cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market Street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the twenty-fourth (24th) day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office—No. 632 Market Street, Room 5, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of September, 1896, an assessment (No. 79) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth (5th) day of October, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of October, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 2d day of September, 1896, an assessment (No. 24) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of October, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 29th day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. A. Keefer, in the Alcyone Mine, near San Andreas, Calaveras Co., to deposit tailings in San Domingo Creek, and from J. R. Sears, in the French Claim, near Indian Diggings, El Dorado Co., to deposit tailings on the bank of Clear Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 14, 1896, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. H. Leek, in the Miocene mine, near Crescent Mills, Plumas Co., to deposit tailings in Rush creek; from Hugh Craig, in the Casajo mine, near West Point, Calaveras Co., to deposit tailings in the middle fork of the Mokelumne river; and from John Faubel, in the Mad Mule mine, near Stella, Shasta Co., to deposit tailings on the bank of Whisky creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 21, 1896, at 1:30 P. M.

And in accordance with law, and an order from the Board of Directors, made on the 13th day of July, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 38, Crocker Building, San Francisco, California, on MONDAY, the 21st day of September, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, Room 38, Crocker Building, San Francisco, California.

DELINQUENT SALE NOTICE.

THE JAMISON MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, on Jamison Creek, near Johnsville, Plumas County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 8) levied on the Sixth (6th) day of July, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
A. Hall	112	2,000	100 00
John Sparks	164	1,000	50 00
John Sparks	165	1,000	50 00
John Sparks	166	2,000	100 00
John Sparks	167	1,000	50 00

John Sparks	169	500	25 00
John Sparks	216	500	25 00
Al. White	236	500	25 00

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of July, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, Room 50, 120 Sutter St., San Francisco, California, on MONDAY, the 28th day of September, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office, Room 50, 120 Sutter Street, San Francisco, California.

Cash Paid.

Any parties having a bona-fide prospect or Gold Mine for sale, can send full description of same and location to LOS ANGELES GOLD MINING CO., 449 Wilcox Building, Los Angeles, Cal.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

220 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition: Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.

By C. W. Moore. With numerous illustrations.....$4 75

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.

By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.

By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hyaraulic Mining.

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.

By T. E. Van Wagenan.....$1 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.

By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.

By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Assayer's Guide.

By Oscar M. Lieber.....$1 50

Assayer's Manual.

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.

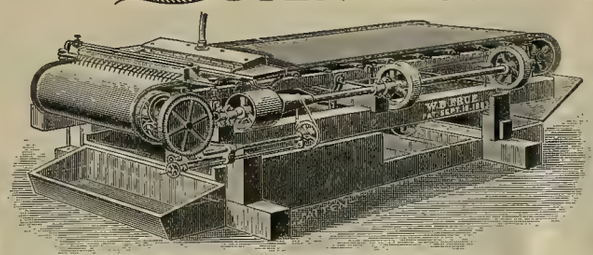
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner ..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner ..... 600, f. o. b.

The Inventive Faculty.

In a late issue of *The Engineer* of London there appears a reply to the criticism of that paper on the article, "Invention, the Indefinable Requirement of the Patent Law," which recently appeared in our columns. Some time ago W. H. Smyth of this city threw out the suggestion that, contrary to all accepted authority, the "faculty of invention" has no separate existence as a special mental endowment, but that "invention" is logical reasoning on the accumulated result of correct observation to the end of supplying a want; consequently that the varying capability of individuals in this particular is a difference in degree only, not one of special endowment. In all the criticisms and comments no one questions the correctness of his position, that much benefit must accrue from training the mind in the direction he suggests. Yet, as he points out, no special effort is made on the part of educators to cultivate those faculties which, whether or not employed in invention, are certainly of great value in all walks of life.

The power of reasoning logically on the results of direct observation is the foundation of all valuable work. Yet, what course of study is systematically arranged to cultivate these capabilities and their co-ordination? The practical and important essence of the discussion, apart from its bearing on patent law, seems to be: Are the faculties in question capable of being cultivated? If so, it is time that this matter receive the consideration of educators, especially in connection with industrial training, for more capital is to-day invested in the products of invention than in any other form of human endeavor.

Following we give extracts from Mr. Smyth's reply:

"It is such questions as these, involving fortunes, which are clustered thick around the interpretation of the word 'invention,' of which *The Engineer* says, 'It is a vain thing to attempt to say what is or what is not invention,' and of which 'it is by comparison easy to say what is, and what is not, invention.' Judge Shepley of the district of Massachusetts apparently takes issue with *The Engineer* on this subject, and on one or two other points, for he has said, 'No more difficult task is imposed upon the court in patent cases than that of determining what constitutes invention—not an invention, observe—and of drawing the line between invention and simple mechanical skill.'

"There never was a time in the history of human intelligence when the mind made bolder inferences or advanced from premise to conclusion with such sure-footed logical leaps and bounds than at present.

"The essential matters for which I am contending, and of the importance of which I have never been able adequately to express an opinion, may be summed up thus:

"That a 'faculty of invention' does not exist.

"That the faculties concerned in the production of new and useful constructions, etc., are not gifts fortuitously bestowed on favored individuals; in other words, inventors are not born specialized in any way more than lawyers, farmers, mechanics, etc.

"That 'invention' does not involve the spontaneous conception of ideas any more than living forms result from spontaneous generation.

"That 'inventions' are the material product of logical reasoning on natural objects and phenomena presented in suitable form by visual memory, having as objects the satisfying of existing wants.

"That the faculties employed are proper subjects for education.

"That, inasmuch as modern civilization is almost wholly based and dependent upon the exercise of the faculties employed in producing inventions, education to be in keeping with modern necessities should be directed systematically to their cultivation for this special purpose.

"That these ideas are diametrically at variance with popular ideas on this subject, and also with the interpretation of invention, etc., by patent offices and courts both in England and the United States, which is in effect that inventions are the product of a specific inventive faculty, and involve the spontaneous conception of ideas. That this faculty is isolated, sporadic and fortuitous in distribution, spontaneously creative in function, uncontrollable and irreducible to order or system, irresponsive to education and cultivation—a gift, a philosopher's stone, an Aladin's lamp.

"That the present interpretation of 'invention' is a source of increasing difficulty and confusion.

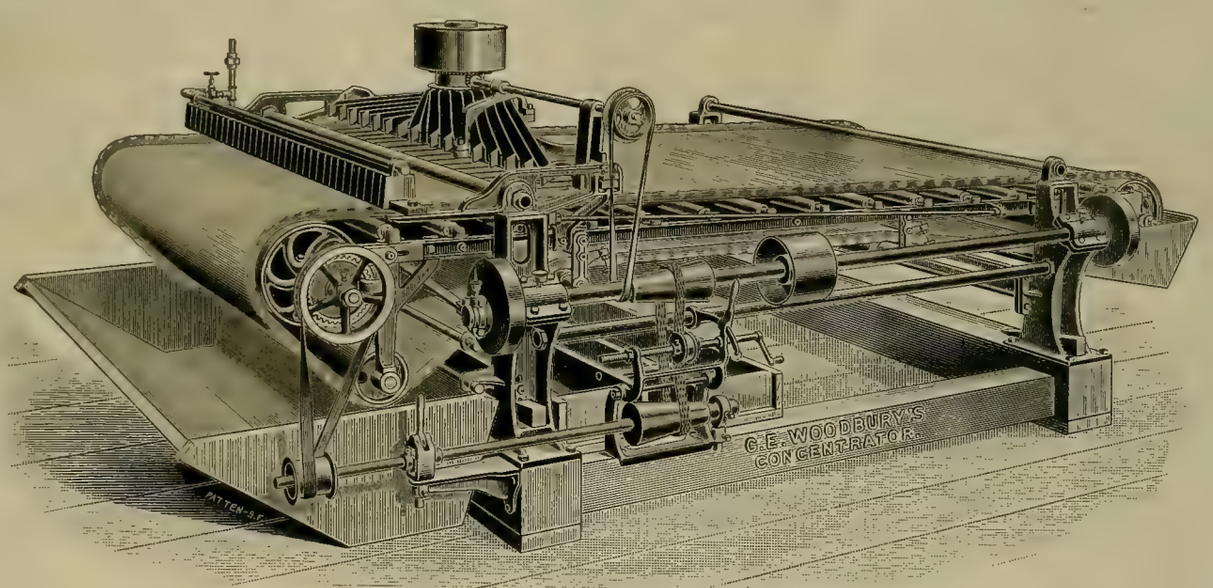
"That, whichever may be the correct view, the words 'discovered,' 'produced,' 'thought out,' 'reasoned out,' cover the same intent, and do not involve questionable interpretation.

"That consequently they are preferable substitutes."

A New Ore Concentrator.

The Woodbury improved side-shake concentrator, a cut of which appears on this page, is the result of the inventor's latest effort to produce a machine of high efficiency for saving concentrates. It is equipped with the Woodbury ruffled edge rubber belt, pulp distributor, adjustable cranks, and is well made in all respects.

The machine consists of an incline shaking frame or table supported upon four upright springs from the four upright corner posts. These springs give the shaking frame a peculiarly even motion that is necessary to give the best results in concentrating. A side shake or lateral motion is imparted to the frame by means of steel connecting rods attached to adjustable cranks. These adjustable cranks allow the operator to adjust the throw or movement of the shaking frame to any desired length, thereby adapting the movement to working different ores.



WOODBURY SIDE SHAKE VANNER OR CONCENTRATOR.

The belt is caused to travel continuously, or at will, by rotating the head drum, the power of which is transmitted by means of a flexible belt which does not affect the movement of the shaking frame. In cases where chains are used for feed work, being ridged, it pulls and jerks the shaking frame, causing the pulp to gather or bank up to the side of belt. The travel is under full control of the operator, and can be regulated to any speed, or started or stopped at will.

The distributing table to this machine is a very desirable improvement. It consists of a slowly revolving bowl or receptacle for the pulp. From the bowl the pulp is discharged in perfectly even quantities of both water and sand, through distributing channels to the whole surface of the belt, and does not allow the pulp to be distributed any more to one side than to the other, and this alone goes a great way to produce perfection of work.

One of these machines is on exhibition and in operation at the Mechanics' and Producers' Fair, now in progress.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Woodbury Side Shake Vanner or Concentrator, 233. Works of the Big Cottonwood Power Company, 238

EDITORIAL.—The Inventive Faculty; A New Ore Concentra or, 233. Railroad Grants and Homesteads; Mine Promoters; Visiting Miners; Mine Owners' Sampling, 234.

SCIENTIFIC PROGRESS.—The Great Work of Preparing the Preliminary Plans for a Railway to Unite North and South America; New Method of Preparing Alloys; Photographing the Sun; One Hundredth Anniversary of the Invention of the Art of Lithography, 238.

ELECTRICAL PROGRESS.—The Big Cottonwood Power Company; Electric Light Bath; Purchase of Street Railway Lines in Mexico; Change in Power Stations; Scheme to Furnish Electric Power to the City of Mexico, 238.

MECHANICAL PROGRESS.—Value of Paints for Ironwork; Locomotive-Making Plant for St. Petersburg; First Consignment of Pig Iron from the United States to the Far East; New Departure in Shipbuilding; Aluminum for the Construction of Railway Passenger Cars; Aluminum Industry in the United States, 239.

PRACTICAL INFORMATION.—Miles of Railroad in the United States in 1896; Defects of Dry Photograpic Plates Due to Packing; Air Tester in the Zurich Industrial Exposition; The Morbid Habit of Dirt Eating, 239.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 242-43.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 250.

MISCELLANEOUS.—Concentrates, 235. Trail Creek Mining District, 236. Two Varieties of California Fissure Veins; Mining Geology of Cripple Creek, Colorado, 237. Statement of Railroads in Receivers' Hands, 238. Coast Industrial Notes; Recent Patents; Notices of Recent Patents; Personal; Obituary; Recently Declared Mining Dividends, 244.

Visiting Miners.

Great interest was taken in a recent report by the Mining Bureau pointing out that the number of working miners in California had doubled in 1895. The numbers given for 1894 were approximately 9000, and for 1895 about 18,000. While this result is gratifying, it is still more encouraging to look to the future, and possibly no surer index of that can be found than in the hotel registers of San Francisco during the past few months. San Francisco is the natural center of travel which focuses all interests on this coast and mine owners and mining superintendents have, to a certain extent, to make it their base of operations.

In the great volume of travel using the hotels at the present time at least every fourth or fifth man is in some way or another connected with the mining industry of the State. Two years ago this was different. Of course, the great majority of mining men who pass through the city come and go unheralded, but to anyone making a study of the matter it is evident that at present there is an unusual amount of travel upon the part of persons associated with the mining industry.

In studying the hotel arrivals there is an interesting point that presents itself. Our visitors are from the North and the South, the East and the West. Recently there have been arrivals, prominent and well-known mining men, from many quarters. London and Paris have sent their representatives. Boston, New York and Chicago have been well represented. More than one mining engineer from South Africa has come, as also have men prominent in the profession of mining engineering from Western Australia, Melbourne in Victoria, and the deep gold mines of Charters Towers in Queensland. All this portends something, and it seems to be that the moneyed powers of the earth are awaking to the fact that here in California is nature's greatest treasure vault, and that they must send out their most expert "cracksmen" if they wish to get at the contents. Another feature is this: One average mine cannot afford to keep the services of a highly-salaried official all to itself, nor is there work for one such man on one mine. As a consulting engineer his services are available for many mines and hence as a consequence corporations or syndicates owning the services of such men lay themselves out to acquire as much mining property as the services they have purchased can be utilized over. Large operators are not now content with a single mine—they want a district—a district which they can control for economical operations.

Amongst the known auriferous areas of the world there are few such existant outside California now available, and of these few none have the natural advantages California has to offer.

Mine Owners' Sampling.

There should be no good reason why a mine may not be sold, to an extent at least, by the samples of ore bodies as well as is coffee or wheat sold by sample in the markets of the world. But the average miner has a pernicious habit of taking samples that are worse than useless in that they deceive not only himself, but others, and lead to no good result.

By sampling is understood the final delivery to the assayer of a comparatively small proportion of ore which accurately represents a much larger body of the same material. That is to say, it will contain precisely as much or little of gold or silver as a ton of the rock sampled. The greater the proportion that is taken of the ore body the more likely it is that it will represent the average body. Haphazard and occasional sampling are worse than useless. They lead to great losses of valuable capital; frequently to a total abandonment of good properties, and, worse than all, to a false sense of satisfaction that discourages improvement by denying its necessity.

Samples ought to mean the average value of ore as mined, including whatever waste has to go with it; for it must be remembered that the main expense with our gold ore is in the mining and not in the milling, so that for this reason a sample ought to represent what is to be mined; whether all of it is put through the mill or not, ultimately, cuts very little figure.

The great trouble with the miner is that instead of taking an average by breaking down large amounts across the entire width of the ore that has to be mined, and then crushing and quartering that down, is very apt to take a few hand specimens that he considers will give about the average result. He should not trust himself in doing that for he is always liable to deceive even himself.

The difficulty the investor finds in telling whether a mine is worthy of examination on the basis of the price asked for it is the very fact that the owner seldom, if ever, takes the trouble to sample his own mine, and consequently many examinations are made of mines bonded on the basis of statements which are found not to be reliable, and sampling becomes a trouble and an expense to everyone, without resulting in a sale.

The prospective purchasers, if they have an extravagant statement placed before them, when they find that the exaggeration has been a gross one, are very apt to discard the entire property in disgust, even though it may still possess merit on the basis of more moderate value shown on examination. The same property, if carefully and accurately represented in the beginning, might have been favorably considered in the end; and so the mine owner should remember that it is a waste of his own time, and detrimental to his own interests, to have his mine examined and adversely reported upon. He should, if anything, discount what the expert will find in his examination. He can always be sure of the real value by sampling his own mine beforehand and presenting the simple fact without color.

Mine owners should remember that mines are not purchased in our day without thorough investigation. It used to be considered important to get proposed purchasers simply to entertain a proposition because the owners always hoped or expected that sanguine views might be taken and the purchase gone ahead with; now it is quite the contrary. Properties are subjected to the most careful scrutiny, and the mine owner would save himself and others a great deal of trouble, useless expense and a bad name for the property by being sure that the facts he represents are accurate and not exaggerated.

What we wish to impress upon California miners is the utter uselessness of making exaggerated statements in the present day in regard to mines. In a majority of cases this is done through ignorance of the condition of affairs. In many cases the owners do not know what sampling is. The result of it all is discouraging to investors, for so many mines are offered and so few taken. It has become so now that proposed investors refuse to go to the expense of making the examination, because the mines offered so seldom show the values claimed; and it is getting to be more and more the custom to insist that the owners shall stand the expense of examination in order to verify their own statements. This is placing a burden upon the mine owners that they should not bear, for, as a general thing, they can not afford it. However, they have brought it upon themselves, to a large extent.

Mine Promoters.

The average mine owner who wishes to sell is not as much given to looking carefully into the credentials of the promoters who come and offer to place his property as he should be. As a result many mines in this State are to-day tied up in the hands of men who will not only accomplish no sales but will retard their development for months or years.

Promoters are as useful and necessary to the mining industry as are brokers in the real estate business, but many men engage in the business without capital and without connection, and do much to bring the business into discredit.

Up into one of the mining counties about two years ago there came a young man representing one of the dailies of this city to write up the district as to its mines. He was to take in other counties, one after another, on his way. The good people of the county owning mines, knowing of their real value and being without sufficient capital to properly open them, saw an opportunity, as they thought, to induce capital to come to them. They suggested to the newspaper man that they would like to arrange for him to devote more than the allotted time to their county, and finally after correspondence with the San Francisco daily, did arrange for him to stay and send down not only columns but pages of honest account of the merits of the county as a place for mining investment.

In a very short time after their publication there came up a horde of promoters, who bonded many of the mines of the county. These bonds were as to term all the way from six months to two years, and they were made without any clause as to development work. It was not long before the good people of this county learned that they had been duped. The promoters were nearly all of the class that might compare to the better men of that business as the "curbstone" brokers to the men who pursue that calling with the backing of capital and have offices where they may be found. These "curbstone" promoters had no backing and were only hoping that a "boom" would bring them opportunities to place the properties they had obtained control of. None of the mines were placed, however, and the development of the county was delayed a couple of years.

All over California there are good mines tied up in this way in the hands of men who obtain bonds, not with a view to presenting the mines bonded to anyone in particular, but in the hope that some one may turn up with whom a deal can be made.

Railroad Grants and Homesteads.

A decision of importance to owners of lands covered by railroad grants has been rendered by the Commissioner of the General Land Office in Washington in the case of W. S. Wynant vs. the O. & C. R. R. Co. The land in dispute is in Josephine county, Oregon. In November, 1894, Wynant made application to homestead it, having lived on it since September, 1883. The land office at Roseburg rejected his application, claiming that the land was on an odd section, and conflicted with the railway grant. Wynant contested the right of the company on the ground that there was an old pre-emption filing against the land when the company's grant took effect, on July 3, 1883. The land office at Roseburg decided against Wynant. He appealed to the Commissioner of the General Land Office. The commissioner has reversed the land office decision and awarded Wynant the land, and says that since the Supreme Court of the United States handed down its opinion in the case of Whitney vs. Taylor, 159 U. S., 85, to the effect that "any filing of record against the land at the time the grant took effect on the land will defeat the grant," the land department has followed that rule. Any old pre-emption or homestead filing, although expired, will defeat the company's right to the land.

Concentrates.

SIERRA CITY, Sierra county, is now lighted by electricity.

A MOVEMENT is on foot to incorporate the town of Jackson, Amador county.

THE old Ruby mine of Sierra county, it is reported, will soon be reopened.

THE railway last week did away with the days of staging into Rossland, B. C.

THE Geldenhuis Deep Company in the Rand in South Africa has developed 900,000 tons of ore.

MAJOR NEWELL is about to put a 120 H. P. engine in his mine in Rogue river near Grant's Pass, Oregon.

IN the Swauk placer mining district, the oldest in the State of Washington, quartz mines are being developed.

THE breaking of the large spur wheel at the Federal Loan mine at Nevada City has caused a temporary shutdown.

IN the Yukon district at Miller's creek there are no saloons running, a miner's meeting having decided against them.

BAKER & HAMILTON, the owners of the Confidence mine in Tuolumne county, contemplate the erection of a 30-stamp mill.

DR. A. MCMAHON and A. McMahon Jr. are preparing to put a 10-stamp mill on the Live Oak and Minuet mine in Nevada county.

THE failure of the First National Bank at Helena, Mont., has caused the closing down of four mines and one mill at Rimini.

THE managers of the Sellick mine at Haywards, Mariposa county, have placed orders in this city for an extensive mining plant.

OVER $200,000 have been spent by the Creston-Colorado Company in Sonora, Mexico, in the past year in improved machinery.

A LEDGE recently encountered on the 1350-foot level of the Argonaut mine in Calaveras county is said to contain 12 to 13 feet of pay ore.

PLACERVILLE people are talking about the erection of an electric power plant near that place to supply the mines and others with power.

COAL has been discovered on the tract of land in Mendocino county belonging to the Slovenian co-operative colony that lately settled there.

A DISCOVERY of gold-bearing quartz in the San Rafael mountains near Las Olivas, in Santa Barbara county, has led to a rush of locators.

THE *Mountain Democrat* of El Dorado county suggests E. W. Chapman of that county as successor to President Neff of the State Miners' Association.

JUDGE H. G. BOND, of Seattle, has bonded the Cordwood Jim mine, adjoining the Treadwell property, on Douglas island, Alaska, for $130,000.

AMADOR COUNTY has placed on exhibition at the State Board of Trade rooms in this city an interesting collection of ores from the mines of that county.

THE July output of the Anaconda mines of Montana was 9,900,000 pounds of copper, or nearly 2,000,000 greater than that of the Calumet & Hecla of Michigan.

THE Zeila mine in Jackson, Amador county, paid its employes in silver last week for the first time under its present management. About $10,000 in silver was distributed.

THE Butte County Miners' Convention will be held in Oroville on Tuesday, September 29th, when delegates to the State convention, to be held in November, will be chosen.

AN English company which had purchased twenty-five mines in the Picacho basin, adjacent to the Goshen mine of the Jayne group, will put up a large mill on the Colorado river.

THE three United States mints coined $2,650,000 in standard dollars in August, the largest amount in a long time. For July this coinage was $1,062,000. The gold coinage for August was $3,315,000.

IT is reported that the asbestos lead discovered in Keystone mountain in British Columbia is 100 feet wide and can be traced three miles. Asbestos has been found in the Province only in north Kootenay.

THE property owned by the Lydenburg mining estates in the Transvaal comprise 32 farms and several blocks of claims on the gold belt, covering an area of 200,000 acres, or nearly 300 miles, in an almost compact block.

ANSON PHELPS STOKES of New York recently purchased a building in Austin, Nevada, and placed the property in the hands of a Board of Trustees, adding his check for $1000, all to be converted into a public library for the town.

THE cyanide mill recently erected by the Dexter Company at Tuscarora, Nev., to work the old mill tailings, is in operation. It is said that these tailings carry $25 in gold, and the plant is saving $20 per ton, at a treatment cost of $1.25.

THE Taylor Park Mining Company of Gunnison, Col., is building a 17-mile ditch to work placer ground. The size is 14½ feet wide on top, 10 feet wide on the bottom and 6½ feet deep, and, it is estimated, will carry 8500 miners' inches.

THE old Pegleg mine in the Mohave desert has again been discovered, and it will without doubt be discovered occasionally for the next hundred years. So will the Gunsight. The fact that these supposed mines are in almost inaccessible places is very much in their favor.

THE Denver *Republican* gives a list of thirty-five leading Cripple Creek mines with a total capitalization of $49,170,000. The shares in these companies at the present selling prices would bring $11,269,850. There are in all about 300 companies and about half as many mines owned by individuals.

THE Yreka *Journal* says: "The mining industry of Siskiyou is advancing every year, and if it continues to go ahead as it has during the past two years Siskiyou will be the leading mining county in the State. During the last year and a half capital has been drifting in and has found a number of good properties in the county. It is a noteworthy fact that, with the exception of Nevada county, Siskiyou employs more miners than any other county in the State. Most of these men are employed on their own claims and are a class that spend the money they make here in this county."

IN 1892 James F. Wardner shipped the first ore out of Slocan district in British Columbia at an expense of $100 a ton. The present cost of shipping and smelting is not over $25 and in a few years it will be reduced to a small proportion of that and low grade ores which would not now be handled will pay a large profit.

ZULULAND promises to become of some importance as a gold mining country. The number of prospecting licenses in force at the beginning of the year was 498, as against 297 twelve months earlier; the number of Europeans engaged in prospecting and mining was 264 against 13, and of natives 1115 against 370.

THERE are reports from Clifton to the effect that the companies are turning out more copper than ever before. Both the Arizona Copper Company at Clifton and the Detroit Copper Company at Morenci have added new machinery the present year, which enables them to reduce their ore at less expense than formerly.

AT Thiard, Idaho, Frank Jenkins recently ran into ore of too low grade to pay expenses, he called his men together and told them that he could not afford to pay wages, but offered to let them take the mill and mine for 60 days and run them on the profit-sharing system. Without any hesitation, the men accepted the proposition.

THE situation at Leadville, Colorado, is practically unchanged. A number of mines are filling with water and even if arrangements are made soon for a compromise, it would be a long time before some of these could start up. The president of the Leadville Trades Assembly says that the difficulty is not apparently nearer an end than it was months ago.

ONE effect of the Leadville strike has been an increase in the smelting rates of Cripple Creek ores, amounting to from 50 cents to $1 a ton. Rates now are $8, $8.50 and $9 a ton—a graduated advance from $8. The scarcity of iron and lead ores for flux throws the increased expense on the smelters, which they are put to in securing them upon the dry ores of Cripple Creek.

THE United States Sub-Treasury in this city recently received $1,000,000 in gold from the Sub-Treasury in Chicago. This shipment was made to partly offset the recent redemption of currency, which amounted to about $5,000,000 taken out in August. In July about $3,000,000 in gold was shipped to New York. At present there is about $40,000,000 in gold, silver and currency in the Sub-Treasury.

THE De Lamar mine of Lincoln county, Nevada, for which $3,100,000 was lately refused, supplies its mill with 200 tons of ore daily and has blocked out enough to keep it running for five years. From this output is obtained a monthly bullion product of $220,000. Under the law a tax of $3.30 upon each $100 of the net earnings is collected, each three months $2.90 of the amount being turned into the county treasury and 90 cents into the State treasury.

THE Spokane *Chronicle* says that miners and prospectors seem to be pushing farther and farther north year by year and from all reports it does not seem that they have yet come to the end of the great mineral belt that stretches away up through British Columbia. Some years ago missionary stationed at Kamloops discovered copper in a cliff west of the station and he had a tunnel run in a distance of twenty feet, but funds giving out the work was discontinued. During the past season considerable prospecting has been done in that locality.

THE Mono mine at Ophir, Utah, which was bought by W. A. Stephens many years ago for $400,000, was bid in at a receiver's sale recently for $350. This mine once contained a big body of horn silver ore, and was capable at times of earning $80,000 net profit per month. It was mortgaged to the Charter Oak Life Insurance Company of Connecticut, which put up the money for Stephens and others. Twenty-nine days after the new owners came into possession the vein disappeared, and although hundreds of thousands were spent in searching for it, it was never found.

IN the South Mountain district in Idaho, a Spokane company incorporated with a capital of $3,000,000, has secured possession of nearly all the old mines in the camp, including the Grand Central, Arthur O'Keefe, Boulder, Laura, Blackstone, Summit, Liberty, Monitor, Fanny Hunt, Virginia, Golconda, Laxey, Smelter, Nancy and Ella. South Mountain has large deposits of galena and lead carbonate ore, Its remotenesss from the railroad has heretofore made successful operation questionable, but with the building of the Owyhee railroad, now in progress, this only drawback has been removed.

MR. PAUL TAVES of Brazil, South America, is visiting Montana for the purpose of learning the latest and most successful method of reducing base and free-milling gold ores. Speaking of the mines of his country he says: "Gold is not the only resource of the country. There are the most marvelous iron mines there that I ever saw. Iron ore in some ledges is so nearly pure that taken from near the surface may be worked up with a forge. The iron mines are not developed to any considerable extent. There is no coal there and that is a disadvantage, as smelting of all kinds must be performed with wood."

THE *Record* of Park, Utah, says that almost every man who has been up Bingham canyon has noticed the spring just above main Bingham, the waters of which are strongly impregnated with copper, and if they had stopped to examine into this freak of nature they would have seen that some one had thrown into the spring a lot of tin cans and scrap iron, and that these are encrusted with a coating of pure copper, but further than this no effort has been made to recover the metal contained in the water. This to many seems strange, for in this spring is a fortune at a small expense for old iron; for, by running this metal-laden water through a series of sluice boxes loaded with old iron, the copper in the water would be precipitated upon the iron, and the product thus obtained would find a ready market at the refineries.

THE Salt Lake *Tribune* says that along the eastern border of Utah, in the Uintah and Uncompahgre Indian reservations, extending through some eighteen townships, there are extensive deposits of gilsonite, the purest known species of asphalt. A highly lustrous though fragile hydrocarbon, it can be used for many different purposes. It is, for instance, the most perfect electrical insulator yet known, a thin sheet resisting a current of 1200 volts. It makes a fine varnish, and is the only substance from which a teredo-proof paint can be made for sea piles. The enamel for patent leather shoes is made from gilsonite. It is thought that eventually a substitute for rubber can be made from this particular substance. It lies in veins of unknown depth, ranging from 1 to 12 feet in width, and extending in places for miles. The veins are very few in number.

REPORTS come from Montana that in the Old Faithful mine, near the town of Bannack, there has been made a discovery of very rich ore. A telegram says that the richness of the ore may be judged by the fact that 17 ounces of the rock yielded a quarter of a pound of gold, and it was not a picked piece either. It would be interesting to know what a picked piece would assay. However, it is interesting to calculate what the Old Faithful would turn out with a good supply of such ore. Say she produces 100 tons a day! At $150,000 a ton, that would mean $15,000,000 a day, or $105,000,000 a week, or $450,000,000 a month or about five billions a year. The late report of marvelous discoveries in Placer county in a San Francisco daily is thrown into the shade by this. One great advantage the Montana story has is the fact that it is too strong to be believed.

A REPORT comes from London that the dominant control Cecil Rhodes has exercised in South African affairs is gone, Rhodes himself being under pledge to come to England to be heard in defense of himself and the British South African Company. Now, it is said, Rhodes, usurping the functions of General Sir Frederick Carington, the commander of the British forces, is trying to make peace with the Matabele chiefs, and has offered them terms which General Carington refuses to accept, and generally deals with affairs in Rhodesia as if he were still master of the situation. The Matabele war, if it continues, will owe its continuance to differences between Rhodes and Carington. The former would make peace on conditions which leave a large portion of the natives armed; the latter on their unconditional surrender and disarmament.

"THE British Columbia mining industry is growing rapidly and must soon find a center. That center must be where there is capital to invest, and where investments can be regulated. The *World* believes that Toronto is that center for Canada. What is wanted is a mining exchange of first-class standing which will so carry on business that the great bulk of the transactions will be conducted under its auspices. Why could not the Toronto Stock Exchange enlarge its scope and try and capture the business? It is worth considering."—*Toronto World.* All right, Toronto. Go ahead and become "that center for Canada" if you can—it will help you and the mining districts, too. But please remember that Spokane is and always will be the center so far as all the new districts of the Northwest are concerned, not "for Canada," but for the whole investigating world.—Spokane Chronicle.

A CORRESPONDENT of the *Mining Investor*, of Colorado Springs, says of reports of mining companies, a subject upon which we wrote lately: "The issuance of reports by companies, monthly reports or even quarterly ones would put an end to a lot of the grumbling that is now going on and is only what the officers of mining companies have a moral right and, in lieu of an every day examination of the books, it would seem, a legal right to do. I think there is much wisdom expressed in the words of a correspondent who says: 'Cripple Creek authorities seem to find their only resource in rude and dogged silence. That is better than smooth lying—but not as good as fair, frank honesty to men who have trusted them with their money.' I do not admit, I am far from doing so, that Cripple Creek authorities in general find their only resource in rude and dogged silence. It is only a few that do so, but this letter is an object lesson of what is going on day by day. The whole is labeled 'no good' because of the actions of the few, the few in this instance being, unfortunately, some of the more prominent companies operating at Cripple Creek."

A TELEGRAM from Washington announces that the Treasury Department has been informed that there is likely to be much suffering among miners at Cook inlet, who are returning from the Alaskan gold fields, unless the commercial companies which took them north provide for their passage home. More than a year ago the Department notified the companies that hereafter the Government could not furnish transportation for these miners and that if the companies took the miners north they should look out for their return. Another telegram from Seattle announces the arrival there of 76 Cook inlet miners and that fully one-third of these paid their way out with money they had taken into the country. One of them said: "You can imagine the condition of the country when it is known that of the two saloons which started up there last summer only one is running. The other had to quit for lack of business. When a saloon will not pay in a mining camp it is a good indication of poverty." An estimate made places the cost of taking the miners in and out of the country for the season at $590,000, and the amount that would be taken out of the mines at $100,000.

THE Grass Valley *Tidings* says that within the last eighteen months five extensive gold mines have been reopened in the Grass Valley district, each with a past record as a bullion producer. Of these the Rocky Bar and Massachusetts Hill has an air compressor plant that has attracted the attention of the mining world. This mine produced over $5,000,000 from early workings. The Allison Ranch, which is now putting in an expensive plant, yielded $4,120,338 before being closed down. The Gold Hill mine, whose pumps are now in operation and which has a magnificent plant run by electric power, produced between three and four million dollars and has never been worked beyond 500 feet. The Bullion Consolidated is now down about 500 feet. It has in the past produced $395,825. The Crown Point has lain idle for years, but has just been started by a French company. This mine has produced $134,000. Add to the above the Brunswick, which has been put under more active management than formerly; also the purchase of new ground by the Omaha, which it is intended to develop. But with all these encouraging outlooks, this should not be considered a favorable camp for outside miners to come to. There is abundant labor at hand to do all the work needed.

Trail Creek Mining District.

The following notes on the Trail Creek mining district, in British Columbia, are taken from the report lately made to the Provincial Bureau of Mines by William A. Carlyle, provincial mineralogist:

Perhaps the greatest factor that will determine the progress of mining, and the realization of the wealth that undoubtedly is now locked up in these mountains, is the means of communication and transport. The ores must be carried to the metallurgical centers for treatment; and if this part of the industry is to be retained in Canada, Canada must assist in boldly advancing these means of communication to make easily accessible the coal fields and the mines from which the different classes of ore can be obtained, that separately are difficult to treat, but brought together and intermixed can be reduced at minimum smelter charges. Favored by the trend of the mountains and valleys, American railroads are rapidly entering from the south to transport Kootenay ores to the American smelters; but, notwithstanding much greater difficulties of construction, Canadian roads must be energetically built, and not only will more mines be opened up, but the large reduction works with the large employment of capital and labor will be mostly retained within this Province. Not only is the bulk of this ore being shipped to the south, but the large proportion of the fast increasing demand for mine and mercantile supplies is being satisfied by the cities on the other side of the border, with the result that a great revival in their business affairs has followed the opening up of these good markets in British Columbia, greatly due to the fact that orders can be now more promptly filled and forwarded from this source, this advantage more than counterbalancing the customs duties that are imposed upon imports. Not only this, but much of the mining machinery manufactured in eastern Canada, and now being extensively ordered, is being brought most of the way over American railroads.

The discovery, during the last two or three years, of large bodies of high-grade gold ores, in which dividend-paying mines are now being operated, is attracting the earnest attention of many mining men and capitalists of both America and Europe. Many claims at points in Trail Creek district are now being carefully examined and bonded or bought, which better means of access and egress, now projected or being completed, will render possible their being worked, and the principals or agents representing capital are investigating these new resources. The fact that men interested in the treatment of ores, or their transportation, on studying the conditions and possibilities now shown, have begun large undertakings, or are now planning them, is indicative that the future development of this part of the Province will be soon on an extensive scale, and of their confidence, based on experience, in the extent and value of its mineral wealth.

The concensus of opinion of many mining men who have studied the conditions and surface showings in this new camp at Rossland is to the effect that few camps have ever shown so many favorable indications that warrant the belief that, on further extensive, systematic exploration, other chutes of gold ore will be uncovered. Prospecting has disclosed these many parallel veins, varying in width when exposed from an inch to several feet, and it is believed that many more ore chutes will be found when these most promising surface indications are thoroughly exploited, for it is quite improbable that the large chutes of rich ore that have been shown on the surface by denudation will be found to be the only ones.

This district has now reached that stage when persistent, plucky development work, sustained by ample capital, must be done to prove up these many veins and surface showings; but a sufficient amount of working capital is demanded (*a*) because much of the rock is very hard to mine, necessitating good machinery to make proper progress (*b*), considerable or even extensive development work must be done in the search for more pay chutes (*c*), while the more or less faulted nature of the ground, though not serious, will complicate this work.

The output from Rossland this year will not show the predicted increase over that of last year for several satisfactory reasons, although there is now, without doubt, much high-grade ore in sight. In the first place, better and cheaper means of transport for ore are being awaited, as the shipping mines are now in such a position that they can afford to hold back their shipments for better rates. Again, the smelter at Trail has not until recently been in such working order as to be able to handle anywhere near the amount of ore it is proposed to treat, nor has the tramway yet the proper facilities for carrying away much ore, but both of these, in a short time, should be able to work up to a much greater capacity. In some cases shipments have been suspended on account of the properties being bonded, or until the completion of underground workings that will make mining more advantageous.

The camp is the scene of constantly growing activity. Much good exploring work has been begun, much more is being projected. Already five air compressor plants are installed, and six more are being put in, while larger hoisting engines and pumps have also been bought. Altogether, $175,000 worth of machinery and supplies have been ordered for this camp.

PRODUCTION.

Total number of tons smelted to July 1st, 1896...	27,085
" " of ounces of gold.....	45,234
" " of ounces of silver.....	67,763
" " of pounds of copper.....	1,265,362
" gross value recovered by smelters.....	$1,007,007

Average net values per ton—gold, 1.67 ounces; silver, 2.5 ounces; copper, 2.3 per cent; value, $37.18.

In the above returns the compilation was made directly from the shipping returns and books most kindly produced for inspection by the officers of the following mines that have shipped ore other than test lots: The Le Roi, War Eagle, Iron Mask, Poorman, Josie, Cliff and Evening Star, and the above results give almost the exact output of the mines at Rossland up to July 1st, 1896. The tonnage is the net, or with moisture deducted amounting to ½ to 1 per cent. The amount of gold and silver given is the actual amount allowed by the smelters, or 95 to 98 per cent of the assay value of the gold contents, and 95 per cent of the silver. The percentage of copper given is the assay value less 1.3, as in the general average value the copper assay would indicate 3.6 per cent of copper in the ore. The gross value includes smelter and freight charges. The output from the free-milling ores of the O. K. mine could not be obtained in time for this bulletin.

DIVIDENDS.

Le Roi.....	$175,000
War Eagle.....	157,500
Total amount of dividends paid to July 1st, 1896..	$332,500

The Trail Creek mining district is located in the southern part of West Kootenay, on both sides of the Columbia river, and along the international boundary line between Canada and the United States. Rossland, the chief mining center, has grown very rapidly to a town of about 4000 people, and is supplied with good hotels, two banks—the Bank of Montreal and the Bank of British North America—churches, stores, a water-works system, electric-light plant, three newspaper offices, postoffice, express office, etc., and is noted for the orderliness maintained by the Government officer, Mr. John Kirkup, and his subordinates, many of the chief elements of disorder usually found in a new mining camp being vigorously suppressed.

History.—Early in the sixties, the placer mines in East Kootenay having been discovered, E. E. Dewdney, now Lieutenant-Governor of British Columbia, was instructed to construct a trail entirely within British territory, through the southern part of the Province, as a passage to the north had been proved to be not feasible. In 1865 this trail, since known as the Dewdney trail, was finished, and in its course it passed about one mile south of the present town of Rossland on its way down Trail creek to the Columbia river. Early prospectors were attracted to the iron-stained cappings; but the low-grade surface rock discouraged them, while the means of getting such ore to smelting centers seemed quite out of reach. However, in 1889, Joseph Bourjouis located the first claim—the Lily May. In this year he located the Center Star and the War Eagle, while the Virginia and Idaho were staked by J. Morris. They also discovered the Le Roi, but forbidden by law to stake more than one claim on the same vein, this piece of ground became the property of E. S. Topping by his simply paying the expense of recording.

The Ore Deposits.—Mr. R. G. McConnell, of the Geological Survey of Canada, after a short visit in 1894, reported the country about Rossland to be "an area of eruptive rock, mostly diorite and uralite porphyrite cut by many dykes;" but as no complete geological survey has yet been made, nor any reported lithological study, only a very general description can now be attempted. The main mass of all the country rock is evidently diorite, although it presents many different gradations in composition and structure, varying from a fine-grained aphanitic rock with very little hornblende at one extreme to nearly massive hornblende at the other, often showing mica and pyroxene. Much of it looks like a basic syenite and samples have been taken for microscopical examination and later report, but the main point of interest is the fact that these ore bodies or veins traverse the diorite, although cores from the hanging and foot walls of the Le Roi chute will be examined, as well as samples from either side of the Center Star ore chute, so well defined in the cliff running up Center Star gulch, to ascertain whether these samples are all one class of rock or two. In going over this region the variations are seen to be very marked, in some places the rock being stratified as if of sedimentary origin, but in all probability a more or less altered eruptive. Porphyry dykes from one foot up to 60 and 80 feet wide traverse the country, many with a north and south strike, but with no apparent dislocation of the veins which they cut through. Indeed, at six such points of intersection the ore seemed to be concentrated, and even to follow along the dyke for some distance, but this must be made clear by further underground work.

In this Rossland ore much prospect work has shown clearly that there is a large system of lines of fracture with an east by west and northeast by southwest trend, and a persistent northerly dip, along which more or less ore has concentrated, either as bodies of solid sulphides or sulphides scattered through the country rock. Some of these fissures can apparently be traced through several 1500-foot claims, and along them are the large ore chutes now being mined or developed, the maximum width of pay ore so far being about 35 feet and maximum length 310 feet. Many of these fissures have been or are now being prospected, and in many instances with surface indications of the most unfavorable character the improvement has been very marked in the increase of the amount of ore and its value, and the great probability that more rich ore chutes will be found by following these fissures has made all such property valuable, and is deciding the commencement of extensive exploratory work. Again, large chutes of low-grade ore, mostly the coarse-grained magnetic iron pyrites or pyrrhotite, assaying from traces to $6 to $8 in gold, have been found and are being explored for better grade ore, and so far with some success. But development, except on a few claims, has hardly yet begun, and so far only the chutes that have been exposed at the surface are being worked, and it is yet impossible to foretell how much extensive underground mining will be rewarded.

The surface of these ore chutes is covered with the typical iron capping, or reddish brown sintery mass, and experience enables the prospector to distinguish between disintegrating sulphides and barren diorite heavily iron stained by the oxidizing of the bisilicates or the iron pyrites nearly always present in this rock. Although it is difficult to prospect such rock, which may be much iron stained but with no vein whatever in the vicinity, nearly all the work is done along one wall, and the ore appears to follow along one wall, where the rock is not too full of fissures that disguise true conditions, but it is doubtful if more than one wall ever really exists, although a parallelism of lines of fracture may for a short distance seem to prove the contrary. Wherever the ore is found to consist almost of pure sulphides, it will be found lying along and parallel to such a wall, after which ore is disseminated more or less through the inclosing rock, often following along small fissures that in some cases form small veins of good ore that run for a considerable distance away from the main deposit. In all the mines the ground is faulted, thus dislocating the ore deposits and stringers and complicating the search; but these slips will be better understood as work progresses, although much development work will have to be done by driving steadily ahead along the general course of the veins and crosscutting, for the good rule of following the ore is seldom possible for any distance by reason of these dislocations.

The Ores.—The ores at Rossland, with the exceptional free milling gold quartz of the O. K. mine, may be divided into three classes:

(*a*) Those large deposits of coarse-grained massive pyrrhotite, locally known as the "iron ore," in which very little or no value in gold is carried.

(*b*) The ore found in many claims on the south belt, as the Lily May, Homestake, Mayflower, Curlew, Gopher, R. E. Lee, etc., in which the sulphides are not pyrrhotite but iron pyrites and marcasite (white iron), with in some of these mines much arsenopyrite, and also zinc blende and even galena, in which case the silver value exceeds the gold and the percentage of copper is very small or nothing.

(*c*) The typical ore of the camp as sold by the Le Roi, War Eagle, Iron Mask or Josie is divided into first-class and second-class. The first-class consists of nearly massive fine-grained pyrrhotite and copper pyrites, sometimes with a little magnetite, or mispickel, with more or less quartz and calcite. In this class of ore, as got from the lowest workings of the Le Roi, the amount of quartz is much higher, the smelter returns giving 41 to 52.8% silica, and 20.6 to 26.8% FeO.; but this is proving the best ore in the mine, the average smelter returns were on 1200 tons 2 6 ozs. of gold, 1.8 ozs. of silver and 2 5% of copper, or $53.05* net per ton, while some shipments went as high as 4.06 ozs. in gold.

The second-class ore, and the bulk of the ore of the camp shipped, will be most probably of this character and value, is a diorite with a comparatively small percentage of these sulphides, but the value is still very good; 1800 tons of the Le Roi, second class, yielded by smelter returns an average of 1.34 oz. of gold, 1.4 oz. of silver and 1.6% per cent of copper, or $27.97* net per ton. Mr. Bellinger, of the Trail Smelter, kindly gave the average analysis of this ore to be FeO. 22%, SiO_2 42.5%, CaO. 7%, MgO. 3%, Al_2O_3 18%; copper, 1.5%, S. 6%.

Treatment.—The destiny of the mining operations of this part of the Province will depend, to a very great extent, upon the means of transportation, and then upon the cost of metallurgical treatment, for a large amount of low-grade ore is promised, and the possibility of treating such ores at a low figure to leave a fair margin of profit must attract the best endeavors of the metallurgist. The ores containing a high percentage of sulphides will be very desirable, and should command the lowest smelting charges, but in all probability the great bulk of the Trail Creek ores will be of the mixed class, or diorite, with a comparatively small proportion of sulphides, and

*Not deducting freight and treatment charges.

hence a low percentage of copper, while again the amount of arsenic, abundant in some of the ore, will be an important element. This ore has now been shipped to many of the American smelters, and now much will be smelted at the new works at Trail. The erection of smelters at Rossland in the immediate vicinity of the mines is being seriously contemplated, but it is yet too early to make any definite statement. The cost of freight and treatment is now about $10 to $14 per ton, when 95 per cent of the assay value of the gold and silver is paid for, and 1.3 is deducted from the percentage of copper present.

Of course, the possibility of other processes being suitable to such ores is being tested, such as the cyanide and chlorination processes, and the result will be awaited with much interest, as some such process may prove very successful, and all judgments should be deferred until the conclusive experiments have been completed.

Two Varieties of California Fissure Veins.

Although the gold quartz veins of California are, with few exceptions, well defined fissure veins, the few exceptions, or variations as they may be more properly called, are of interest because they present some unusual features. The deposits referred to are those associated with certain porphyry dikes. Mr. H. W. Turner,* in a recent paper, says:

Indeed, the field and subsequent laboratory investigations make it reasonably probable that some of the quartz veins along the mother lode have been formed by replacement of the feldspar of these dikes with silica. This is best seen in the neighborhood of the Tuolumne river, where these dikes accompany the lode at most points and are often filled with secondary quartz veinlets, dolomite and specks of iron disulphide. This is finely shown at the north end of the croppings of the Bachelor quartz vein on the north bank of the Tuolumne river, two miles southeast of Jacksonville. The vein lies at the contact of a body of serpentine on the west and a body of clay slate or schist, probably of Carboniferous age, to the east. The slates dip N. 30° E., at an angle of about 65°. The vein itself is composed of white quartz, dolomite and mariposite, a micaceous mineral often of a bright green color. Just east of the vein, in the clay schists within a width of thirty feet, are six or eight dikes. The dikes vary from two inches to two feet in width. Quartz veinlets, one with a convoluted course, cut both the schists and the dikes. Between the dikes and the ledge is a broken-up mass of the dike rock of a reddish-brown color, penetrated by quartz veinlets and seams of dolomite and apparently in a fair way to form a quartz vein, like that immediately west, if the alteration should go farther. This mass seemed a friction breccia and would indicate movement and faulting along the vein. A microscopic examination of this breccia showed it to be made up of fragments of the dike rock cemented by dolomite and quartz. Throughout the rock, as well as in the dikes just east, is scattered iron sulphurets (FeS_2) in minute specks. The brown color is due to abundantly disseminated limonite. The microscope shows the dike rocks, where not replaced by silica and dolomite, to be composed almost entirely of interlocking grains of feldspar with some larger twinned feldspars, in fact, identical as to composition with other similar dikes, which may be seen along the mother lode one mile to the northwest or about one mile due east of Jacksonville, and to the east of Moccasin creek on the south side of the river. Although the dike to the east of Moccasin creek contains at several points numerous quartz veinlets, at no point was there as good evidence obtained of the formation of quartz veins of some size by replacement of the feldspar of the dikes with quartz and dolomite as at the place just described, on the north bank of the Tuolumne river.

In the bed of Moccasin creek, at its mouth, is a large cropping of white granitoid rock. This is the north end of the Moccasin creek dike, which extends thence nearly or quite continuously southeasterly for about two and a half miles. It crosses the road to Groveland, about one-third of a mile east of the bridge over Moccasin creek. Except at the north end, it lies entirely to the east of the creek, gradually increasing in altitude and in distance from the creek to the southeast. This dike was first noted by the writer in 1886, but no investigation was made as to its nature. It is mentioned by H. W. Fairbanks in a paper on the "Mother Lode" (10th Ann. Rep. State Min. California, p. 45), but was called by him a granite dike, which rock indeed it resembles to the naked eye, and, as noted above, the north end of the dike is a soda-granite, as the term is used by Rosenbusch, or soda-granulite, according to Michel Levy. Specimens of this dike were collected at a number of points. The granitoid portion at the north end contains a good deal of quartz, and may be called a soda-granulite. It is composed of quartz, muscovite and albite or soda-feldspar. By far the larger part of the dike, however, is made up of albite feldspar only, and is mostly finer grained than the granitoid rock of the north end. It may be designated a soda-syenite (albitite) porphyry. Thin sections from different portions of the dike show a somewhat different structure and composition, but the variation is small. The porphyry is made up chiefly of the interlocking grains and prisms of albite, often untwinned, and in some sections there are definite phenocrysts of polysynthetically twinned feldspar (probably likewise albite) developed. Rather abundant in some specimens is an olive-green mineral, in grains and prisms. The extinction is sensibly parallel to the prism, and the interference colors are bright. Good cross sections showing beyond doubt the nature of the cleavage were not found, but so far as could be made out the cleavage is similar to that of ægirite, and it is thought to be that mineral. These dikes, therefore, show some analogy to certain dikes in Norway, described by Brogger, and called by him solvsbergite. The variety found near Lougenthal is composed chiefly of albite, but contains also microcline, hornblende (katoforite and some arfvedsonite), ægirite, traces of biotite, and quartz, accessory apatite, and zirkon, and occasional minute grains of a perovskite-like mineral.

Dikes of syenite-porphyry were also noted in some siliceous schists or thin-bedded quartzite of presumably Paleozoic age to the north of the Merced river. One of these dikes about nine miles southeast of Coulterville, in a much decomposed condition, can be traced for a mile or more with a strike to the west of north. The soft, decomposed dike material has apparently been auriferous, as numerous cuts have been made in it and claims located. As this particular dike was not investigated chemically or optically, it is quite possible that it contains some free quartz.

In the canyon of the Merced, on the steep slope west of the river just down stream from the mouth of the north fork, are from fifteen to twenty white dikes from six inches to six feet in width. These dikes are nearly vertical, following the dip of the schists (75° E.), but at other points cutting them at a slight angle. This group of dikes may also be called a multiple dike. A section from a similar dike, probably a continuation of one branch of the multiple dike, taken just opposite on the east side of the river, shows a few twinned needles of a pale-brown hornblende, and numerous idiomorphic phenocrysts of plagioclase in a microcrystalline granular ground mass of feldspar, muscovite and probably quartz, for the silica contents (71.88%) is too high for all the silica to be in the constituents already mentioned. In the table of albite analyses given in Dana's Manual of Mineralogy, 65% is the highest amount given, and it is therefore evident that if no more basic element than albite were present, the silica percentage could scarcely reach the amount found by Mr. Steiger in the rock. Nevertheless, no quartz was certainly microscopically determined in the rock. The feldspar phenocrysts are many of them twinned on the albite law giving symmetrical extinctions on the trace of the twinning plane (010) of from 6.5° to 21°, the average of nine crystals determined being 13°; none were detected showing albite and carlsbad twinning combined, so that the new method of Michel Levy (Etude sur la determination des feldspaths, 1894, p. 33) for determining feldspars could not be applied. From the lime percentage of the rock (2.03%) and from the general tendency of the more basic feldspars to crystallize first, and the apparent formation of epidote directly from the feldspar phenocrysts, it is presumed that they are near andesine in composition. The rock may be provisionally called a soda-granite porphyry.

Along the borders of the serpentine area from six to seven miles southeast of Coulterville are several soda-syenite dikes. Some of them follow quite closely the contact of the serpentine and the adjoining rock, which, to the east of the serpentine, is a greenstone (apo-augite-andesite) tuff and to the south is the same belt of siliceous Paleozoic schist or quartzite before noted. One of these dikes apparently forms the lode of a gold deposit, as it had evidently been mined. It is much altered in places, containing abundant quartz, calcite or dolomite, and sulphurets.

In another paper Mr. Turner describes altered porphyry dikes, composed chiefly of albite, as forming the lodes of the Shaw (Big Canyon) and Oro Fino mines in El Dorado county. The feldspathic nature of the Shaw mine was first suggested by Mr. C. A. Aaront in 1892. In describing it Mr. Turner says‡:

The deposits occur in clay schists associated with a dike or dikes of feldspathic rock. * * * The dike rock is more or less decomposed, and is at some points replaced by secondary white feldspar which at other points cuts the dike rock in little seams. This feldspar was determined to be albite. In two specimens of albite there is free gold.

In regard to the Oro Fino mine Mr. Turner says: * * * On the west side of Big Canyon creek is a dike of rock about 1500 feet long with a nearly south and north strike * * * the dike is much broken and recemented into breccia * * * it is auriferous * * * the country rock is clay slates; the same belt as the Shaw mine.

Somewhat related to these deposits are the true fissure veins which lie along or near similar dikes. The Sheep Ranch and Camp Seco mines in El Dorado county and the Black Oak mine in Tuolumne county may be cited as examples. In these cases the dikes are very little altered, but they are undoubtedly older than the veins, for they are often cut by small veinlets and small inclusions of the dike rock are found in the quartz. In this class of dike associated veins the relation is probably only structural and not chemical, also as in those described by Mr. Turner.

The dike represents a vent of eruptive rocks formed by some older fissuring. The fissuring which offered leeway for quartz deposition seems to have followed the dikes as a plane weakness, or rather of least resistance.

In the second variety the veins cannot be said to be more than ordinary fissure veins; in those described by Mr. Turner there has evidently been fissuring to allow the circulation of the solutions which replaced the feldspar of the dikes.

Mining Geology of Cripple Creek, Colorado.

Synopsis of Report of WHITMAN CROSS and R. A. F. PENROSE, JR., to the United States Geological Survey—By H. C. HOOVER.

Two well organized but unsuccessful attempts were made to find gold in the district previous to the discoveries made in 1891. The total production estimated by the mint from 1891 to 1894 was $5,543,967.

General Geology.—The group of hills containing the mines of Cripple Creek are almost entirely made up of volcanic rocks. The results of the investigation demonstrate that there was here a small vent, in and about which the sequence of phenomena has been remarkably complete and typical of a true volcano. The principal material is fragmental, resulting from a succession of explosive outbursts. Massive lavas occur, representing bodies that have been largely destroyed by succeeding explosive periods of the volcano, and other masses representing intrusive dikes and masses belonging to the later eruptions. The earliest lava was an andesite, which was followed by a great number of eruptions of phonolite. As the last products of the eruption, there are a number of basic dikes through the other lavas. The dying out of activity of the volcano was represented by much sofataric action and decomposition of the country rocks.

The formation through which this volcano burst, and upon which its superficial material lies, is the granito-gneiss complex of the Colorado range. These rocks have been much altered by the volcanic agencies, and have been intruded by many dikes of phonolite and allied rocks. The surface has been much changed by erosion since the volcanic activity.

Ores.—The ores consist of country rock more or less completely replaced by quartz, fluorite and other minerals in less quantities. The gold occurs free as tellurides of gold and possibly as auriferous iron pyrites. The free gold is derived largely from the oxidation of the telluride and in smaller amounts from iron pyrites. The tellurides are mostly calaverite, but sylvanite and other tellurides occur. Silver occurs in various forms, but in very small quantities. Superficial alteration has caused oxidation, hydration and leaching of some of the minerals, forming sulphates, phosphates and other oxidized compounds. The value of ores shipped from the district varies from $20 to several thousand dollars per ton. There are large bodies of low-grade ore—too low to work economically at present.

Mode of Occurrence of the Ores.—The veins occur in fissures, which lie in or near the above described area of eruptive rocks. These rocks overlie and partly surround a volcanic vent, and are themselves surrounded by granite. The fissures are usually represented by one main fracture, with numerous subordinate parallel fractures. They show some faulting and are considerably affected by the character of the country rock through which they pass. Veins do not occur in all fissures and the vein matter blends laterally into the country rock. The ore is due rather to replacement of the country rock than to the filling of open gaps. The veins frequently have definite relation to the dikes, generally because the vein fissures often follow the pre-existing dikes as planes of greatest weakness from former fracturing. The deposition of the ore in shoots is due in some cases to a restricted circulation of the ore-bearing solutions, guided by the more permeable places along fissures. In others it is determined by transverse fissures and a variety of minor causes. Most of the shoots found in the district reach the surface.

Source and Mode of Deposition of the Ores.—The gold and associated vein minerals are probably derived from volcanic rocks and to a less extent from adjoining granite and at considerable depths.

Practical Points for Miner and Prospector.—As the veins occur in great numbers, often a series of parallel veins, frequent crosscuts should be made in search of these parallel ore bodies. A very few miners have done this and some good mines have probably been abandoned for lack of it. Certain fissure planes are often regarded by the miners as walls and are supposed to be the side limits, beyond which no ore occurs. These "walls" often represent divisional planes in a zone of ore deposition and

should constantly be blasted into. A great deal of ore has been left from this delusion, only to be secured by much additional labor later.

Nearly all the pay shoots found in the district reach to the surface. It is, therefore, better to prospect the surface of a vein thoroughly before sinking. The error has repeatedly been made. Moreover, it is not safe to count on much better ore in depth than upon the surface, for, aside from some superficial leaching, there will probably be little increase in values. The gold ores are free within the zone of superficial oxidation, but will be in combination with tellurium and iron pyrites in depth. As the veins often follow dikes, it is well to examine the dikes for ore. The fissures, if not immediately upon the dikes, often run parallel with them, so that it is well to crosscut the surface in the neighborhood thoroughly.

In the above I have only given the general results and readers are referred to the original article for technical description of localities and fact bases of conclusions.

Scientific Progress.

AT the headquarters of the Inter-Continental Railroad Survey, in Washington, D. C., the great work of preparing the preliminary plans for a railway to unite North and South America has been going on in a quiet way for several years. The survey has been carried southward by Mexico and northward by Brazil, while the detailed connecting survey has been done in Central America by a detail of United States Army officers under the direction of Lieutenant Macomb. The results of the field work are now being reduced and computed. The extent of the survey involved geodetic work of magnitude, and the final results checked up in a most satisfactory manner. Many of the altitudes were first determined by the barometer, and the chosen altitudes were subsequently measured either trigonometrically or by spirit leveling, and the closeness which appeared between the barometric determinations and the subsequent measurements was gratifying to those who believe that the barometric method still has a future before it.

IN a memoir to the Paris Academy of Sciences, M. Moissan describes a new method of preparing alloys, especially of the refractory metals. He finds that by adding a mixture of the oxides of the metals and powdered aluminum to a bath of liquid aluminum, he is able to obtain alloys with molybdenum, titanium, tungsten, uranium, etc., the heat set free by the oxidation of the aluminum being sufficient to promote the reaction. Some of the alloys produced in this way may be found useful in the arts.

IF it be true that science advances through failures, the clouds which prevented the observation of the total eclipse of the sun on August 8 may be a blessing in disguise. During the past quarter of a century, several astronomers have taken up the problem of discovering a means of photographing the corona in broad daylight, but the results have not been very encouraging. In the photography of solar prominences, Prof. Hale and Dr. Deslandres have obtained distinctly valuable pictures, and, were it possible to delineate the corona with the same success on any day when the sun is shining, our knowledge of the nature of that solar appendage would increase much more rapidly than it can at present, when the only opportunities for studying it are afforded by the brief moments of totality of a solar eclipse. Perhaps this latest experience will induce solar physicists to give further attention to the artificial reproduction of eclipse conditions. It is, of course, not suggested that every-day observations will make eclipse expeditions unnecessary—there will be work for astronomers during solar eclipses for a long time to come; but if it were possible to carry out systematic researches on the structure and constitution of the solar surroundings, instead of depending entirely upon the rare intervals when the photosphere is obscured, several moot points might be settled before the end of this century. —Scientific American.

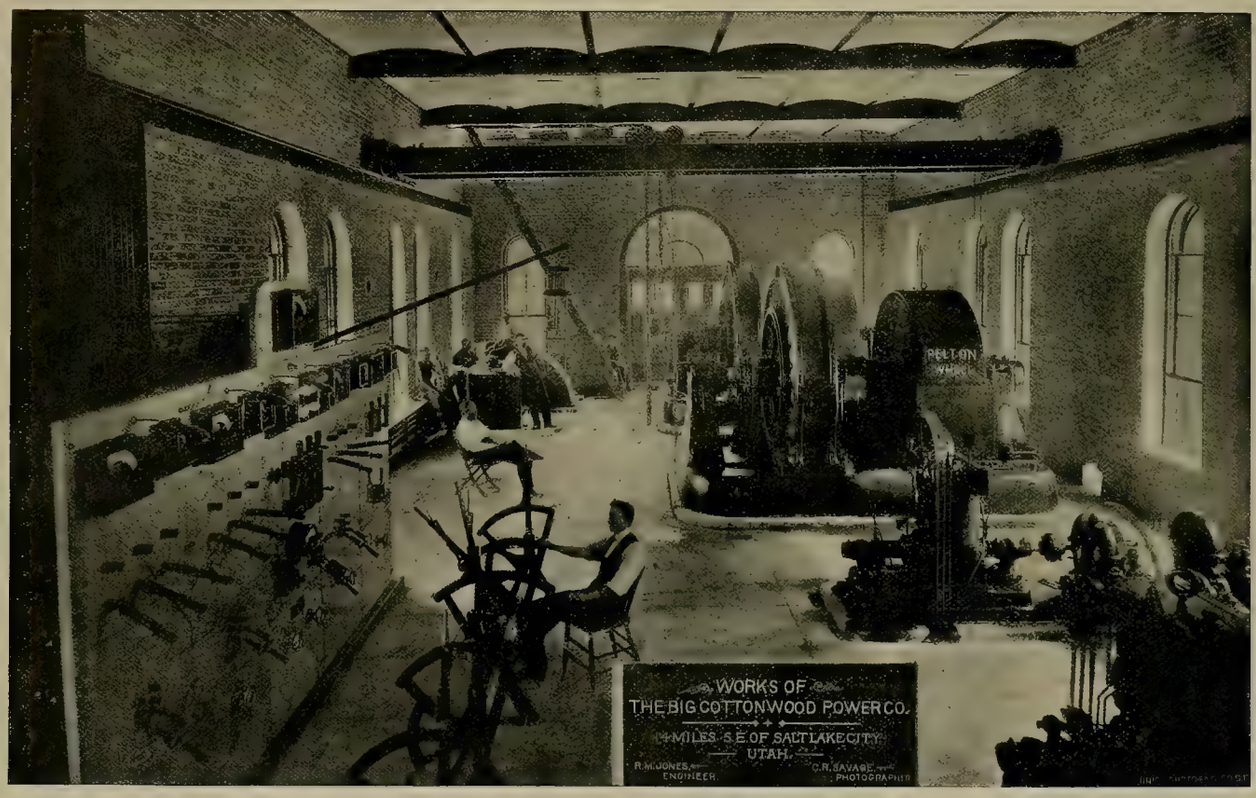
NEXT month in New York will be celebrated the one hundredth anniversary of the invention of the art of lithography by Alois Senefelder. The celebration will take place in the form of an exhibition of different products of lithography and will illustrate the history of the art from its birth to the present day. Specimens and prints from the earliest date and from all civilized countries will be shown. The exhibition will be open Oct. 16 and 17. Joseph R. Keogh, 142 Koscuisko St., Brooklyn, N. Y., is the secretary.

Electrical Progress.

The Big Cottonwood Power Company.

One of the most important electric power installations in the country is now in successful operation in Utah. It is located in the Big Cottonwood canyon, fourteen miles from Salt Lake City, the stream from which affords a supply of 4,000 cubic feet of water per minute at the lowest stage, which under the head available develops 2,500-horse power. The water is brought to the wheels through 2,400 feet of 50-inch pipe, made of plate steel varying from ¼ to ⅜ inch in thickness, made in sections of 32 feet, which are connected by steel flanges.

The power station consists of four 60-inch Pelton wheels with a capacity of 650-horse power each, running under 370 feet head at 300 revolutions. These wheels are direct connected to four General Electric generators, three-phase type, both mounted on the same bedplate. Special wheels are provided for running the exciters, which are also direct connected.



The power thus generated is transmitted to Salt Lake City and used for running an extensive system of street railways as well as for lighting and general power purposes. An additional water supply is available, which it is proposed to utilize later, increasing the capacity of the station to 5,000-horse power.

These works have involved an outlay of something over $500,000, all of which has been furnished by local capitalists. The company states that contracts for power have already been made, which afford a revenue of $100,000 per year, with a considerable surplus of power yet to be disposed of, which insures a dividend of not less than 20 per cent per annum over and above interest and operating expenses.

The financial as well as engineering success that has attended most enterprises of this character in various parts of the country, has given assurance of safe and profitable returns to all such investments where planned with proper reference to cost of installation and commercial value of the power produced.

AN electric light bath is now proposed to take the place of the steam room of the Turkish and Russian bath establishments, and if the hopes of the inventor are realized one may be able to indulge in the delights and benefits of a Turkish bath without suffering the discomforts of the suffocating department where one feels himself being cooked absolutely, in order to induce an excessive perspiration, says the Philadelphia *Item*. The invention consists of a cabinet lined within on all sides with large mirrors. Electric incandescent lamps are arranged about the inner walls in great number, and in such manner that their combined light and heat will be reflected by the mirrors in the center of the cabinet. A movable couch, to support the body of the bather in a reclining position, is arranged in the middle of the cabinet. This couch is provided with a glass top on which the bather rests, and a mirror chamber beneath the top. Incandescent lights are provided in this chamber so that their heat and light are reflected up through the glass top of the couch to the body of the bather. The inventor claims that with this apparatus induced perspiration is caused at a much lower temperature than is possible by either a Turkish or Russian bath, and also that it is much superior to said baths in the stimulation of protoplasmic activity and more powerful to promote the action of the skin and eliminate carbonic acid.

A COMPANY of American capitalists have completed the purchase of all the street railway lines of Monterey, Mexico. They will be converted into electric lines, thus providing Monterey with the first electric street railway system in the republic.

DURING the past three years there has been a marked change in power stations from a large number of small units to a smaller number of very large units with direct communication to the engines.

THERE is a scheme on foot to furnish electric power to the city of Mexico from peat beds, nine miles distant, owned by Boston interests.

THE *Railway Age* gives the following statement of roads in receivers' hands on June 30th last:

	No. Roads.	*Miles.*	*Capitalization.*
In hands receivers on June 30, 1895	169	37,855	$2,500,000,000
From June 30, '95, to June 30, '96	38	5,576	410,000,000
Totals	207	43,431	$2,910,000,000
Sold from June 30, '95, to June 30, '96	57	14,437	$1,009,899,000
In receivers hands June 30, '96	150	29,994	$1,900,101,000

Mechanical Progress.

AN account of some researches on the value of paints for ironwork, made by Professor J. Spennrath, has been published in the *Deutsche Banzeitung*. As one result of these, Professor Spennrath concludes that none of the metallic oxides commonly used combine chemically with linseed oil. The drying process depends exclusively on an absorption of oxygen by the oil, which is facilitated by the presence of the pigment in a purely mechanical way. The value of the different pigments used varies. Thus, zinc white, when used for outside work, rapidly swells to double its previous volume, owing to the absorption of carbonic-acid gas and water. Sulphuretted hydrogen will cause red or white lead to act in a similar way, but, when pure, these two latter pigments are satisfactory. Carbon paints are very stable, as in heavy spar, but the covering power of the latter is small. In order to test the relative durability of various paints, sheets of zinc were coated with a number of different kinds. The zinc was then dissolved away by acid, leaving a film of paint. All these films, it was found, could be destroyed by the action of dilute nitric or hydrochloric acids, while the vapors of sulphuric and acetic acids acted similarly. Alkaline fluids and gases also destroyed the paints rapidly. Pure water was found to be more injurious than salt water, hence the destructive action of sea water is to be attributed mainly to the mechanical effects of wash. Hot water was found to act more rapidly than cold. The most important discovery made was, however, the great influence of temperature. Films similar to those already described completely lost their elasticity and became brittle when exposed to a temperature of 203° Fahr. There was at the same time a large contraction. Similar effects are produced by prolonged exposure to considerably lower temperatures. Blistering he finds due to the inner coat of paint being so thick that it has not hardened thoroughly before the second coat is applied.

AN entire locomotive-making plant will be taken soon to St. Petersburg from Philadelphia, to be erected at Nijni-Novgorod, the commercial metropolis of the interior of the Russian Empire. Contracts for machinery for the plant amounting to over $500,000 were awarded to American manufacturers, most of them going to Philadelphia firms. The plant is to be built for the Sarmová Works, an extensive establishment engaged in manufacturing cars, steamboats, steam boilers and employing 5000 hands. The locomotive plant will have a capacity for building 200 engines a year, and will employ about 1000 hands. All of the foremen and engineers will be Americans. The buildings have been completed and are now ready to receive the machinery. The Czar has given valuable encouragement to the enterprise. Nearly 85 per cent of the railways in the Empire are operated by the Government, and the new company will get a great share of the work for them. The company will be known as the Russian-American Manufacturing Company. — Scientific American.

THE first consignment of pig iron sent from the United States to the Far East will be taken to Japan from Philadelphia. The iron came from Alabama. The Japanese propose to test the iron by using it in the manufacture of various kinds of ship and railroad machinery, and, if satisfactory, larger quantities will be ordered. Samples already sent there induced the purchase of the consignment, which was found to be superior to the European product. While the cost of the product is less than either the English or German product, the transportation charges alone prevent the driving from the Orient of all other iron.—Railway World.

RECENTLY there was launched at the Cail Engineering Works at St. Denis, France, a steamer which marks a new departure in shipbuilding. The innovation consists of the employment of a series of rollers on which the vessel proper is carried. The cabins, deck, and engines rest on a large platform supported by six huge hollow drums, which work in couples. There are four engines, developing altogether 200-horse power, which simultaneously drive the propeller and give a rotary movement to the drums. It is estimated that a speed of 25 knots will be attained. The length of the steamer is about 130 feet and her tonnage 280. She will be completed at Rouen, and will, it is anticipated, be ready for her trial trip in October.—Industries and Iron.

"SCHMALSPURBAHN," says the management of the French state railways has obtained permission from the minister of railways for the construction and reconstruction of a number of passenger cars in which all the parts formerly manufactured from brass, copper and iron, with the exception of axles, wheels, bearings and springs, brake beams and couplings, shall be constructed of aluminum. The weight of a car provided with aluminum trimmings was 1½ tons less than that of an old style car. It should be added that the French passenger coaches are much smaller than the American cars. As an ordinary train in France consists of 20 coaches the weight of the train would be reduced by 30 tons, which means a considerable saving in operating expenses.

ALTHOUGH the aluminum industry is not a large one in the sense that the iron industry is, it is growing very rapidly. The output of the United States in 1894 was 550,000 pounds, and in 1895 it was about 850,000 pounds.

Practical Information.

ADVANCE sheets of *Poor's Manual* for 1896 give the total miles of road at the close of the year as 180,955, of which 1,922 miles were constructed during the year. The share capital was $5,182,121,999, an increase of $106,492,929 or 2.1 per cent. The funded debt of all lines amounted to $5,640,942,567, an increase of $35,166,803 or .63 per cent. Other forms of indebtedness amounted to $418,505,092, an increase of $35,577,258. The total gross earnings of the roads were $1,093,139,605, an increase of $25,496,092. Net earnings were $323,196,454, an increase of $5,439,055.

The street railway lines in the country foot up 15,596 miles, an increase of 3,514 since 1891. The capitalization, representing all but 530 miles, amounts to $828,547,285 in stock and $525,949,928 in bonds.

The earnings of 17,269 miles of trunk-line roads last year were 817 millions, compared with 807 millions in 1894 and 923 millions in 1893. Net earnings were 251 millions, against 247 millions in 1894 and 279 millions in 1893. The dividends paid amounted to 1.95 per cent on the share capital invested, compared with 2.28 per cent in 1894, 2.40 per cent in 1893, 2.43 per cent in 1892, and 2.46 per cent in 1891.

The following statement shows the results of the operations of the railroads of the United States for the year 1895, compared with those for 1894:

	1895.	*1894.*	*Increase.*
Miles of railroads oper'd.	179,162.18	176,229.11	2,933.07

* Decrease.

A. L. HENDERSON, in a paper lately read before the London and Provincial Photographic Association, described a series of experiments he had made in regard to the defects or deterioration of dry plates due to packing, and came to the conclusion that paper was unsafe as a receptacle for holding plates. His recommendation is that plates be separated by strips of tinfoil and stored in metal boxes, a suggestion which seems feasible in view of the facility which the X rays have of passing through paper. There appears to be a phosphorescent action from paper on the film, as well as chemical, according to the results of his experiments.

IN the Zurich industrial exposition an air tester is exhibited, which shows whether and in what degree the air in a workshop is contaminated. The apparatus consists of an air-tight closed glass vessel filled with a red fluid. Through a glass tube that dips into the liquid, and is bent at the top, a drop falls every hundred seconds on a cord that hangs beneath and that is somewhat stretched by a weight. The fluid from which the drop comes has the property of changing its red color to white by the action of carbonic acid. The more carbonic acid there is in the air the quicker this change in color takes place. If the air is very foul the drop becomes white at the upper end of the cord, while the change of color corresponding to a slight proportion of carbonic acid does not take place till the drop has run farther along the cord. The exact condition of the air can be ascertained by observing a scale that is placed alongside the cord.

IN the Edinburgh Hospital Reports Dr. John Thomson publishes a study of the morbid habit of dirt eating in various parts of the world. It is his belief that the dirt has a well-defined hygienic value, and is eaten by children for medical purposes. The physical ailing which brings on the appetite for dirt is in most cases anæmia, which simply means a running down of the system. In these cases the habit might be formed from an instinctive craving for earthy salts, such as iron and lime, just as a cat or a dog, when needing a little physic, will eat a blade or so of grass. The eating of substances of various kinds which are not only indigestible, but are also devoid of any natural attractiveness of taste, is a morbid habit which has often been observed both in human beings and among certain of the lower animals.

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

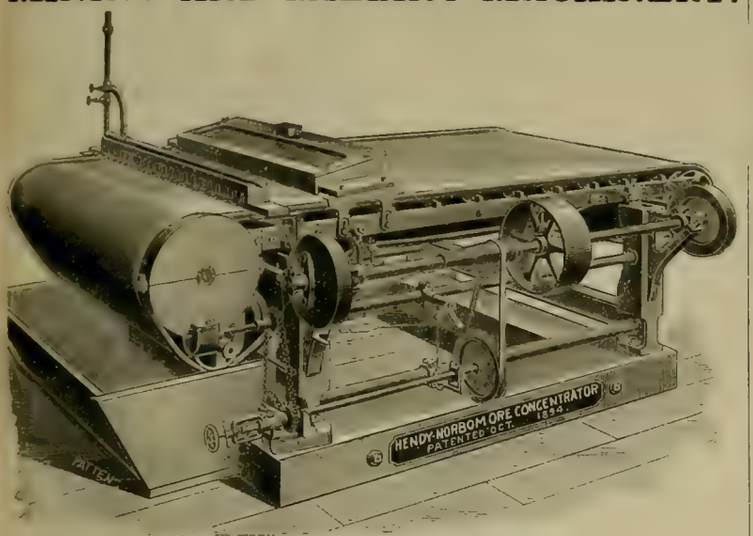
MINING AND MILLING MACHINERY.



HENDY - NORBOM ORE CONCENTRATOR.

Office of ORLEANS MINING COMPANY, GRASS VALLEY, CAL., Dec. 12, 1895.

Mr. John O. Norbom, San Francisco, Cal. – DEAR SIR: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3½ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly. [SIGNED] C. A. BROCKINGTON, Superintendent.

Office of FEDERAL LOAN MINING COMPANY, NEVADA CITY, CAL., Dec. 10, 1895.

Mr. John O. Norbom, San Francisco, Cal.—DEAR SIR: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly. [SIGNED] J. VINCENT, Superintendent.

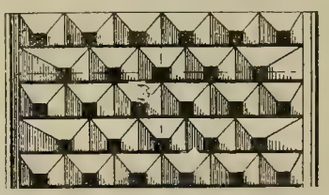
PAYNE'S PATENTED GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Mining Summary.

CALIFORNIA.

Amador.

At the Gwin mine the ledge at the 1300-foot level is 20 feet wide, as developed by the crosscut. The ore shoot in the old workings was 1100 feet long, and the new workings show an increase to 1300 feet, making it one of the largest ore bodies in California. The rock is expected to average $8 a ton.

At the South Paloma the vein is looking well. The fissure is 5 feet wide and nearly filled with rock of a similar character to that in the Gwin.

Ledger: W. and H. Dennis are putting a mill on the American mine, near the Treadwell property.

The two-compartment shaft on the Pocahontas mine has been commenced and will be pushed rapidly.

Dispatch: Work at the Amador Queen No. 2 mine has been temporarily suspended.

Work of putting in a station and crosscutting is now in progress at the Anita.

One thousand feet is the objective point of the management of the Alma mine. After that depth is reached the work of crosscutting and opening up of the property will begin.

Republican: The Del Ray mine has made arrangements with the Amador Queen No. 1 mine to mill fifty tons of ore as a sample test of their ore. If these tests prove satisfactory, they will shut down and put up a hoist and will erect a mill of fifteen stamps.

The Argonaut Mining Company has just completed a station at the 1250 level and intends cutting another station at the 1350 level soon.

Calaveras.

Mountain Echo: The water is being taken out of the Pure Quill mine preparatory to prospecting for the vein.

The Specimen mine at Fourth Crossing is prospecting well, and a vein of milling ore 14 feet in width has been discovered.

Chronicle: At the Hartmann mine the new hoist and mill is nearly ready for operation. The shaft is down to bedrock, a depth of 55 feet.

Angels *Voice*: A. N. Butts has given up his bond on the Chaparral Hill property, as the time allowance, ninety days, was insufficient to prospect the property. It is now under consideration by a French syndicate, represented by M. Chambry of Paris. The company is extensively interested at Crown Point and other places.

Prospect: At the Santa Ana and Missouri mines, which are operated by Col. Woodrow, it is reported that very good rock has been found.

Citizen: The ledge recently encountered in the 1350-foot level of the Argonaut is from 12 to 13 feet wide and is rated from $6 to $10 per ton.

The Lewis gravel mine at Vallecito has been sold for $9000. This mine will be operated as soon as the season for hydraulic mining opens.

The owners of the Barnhardt gravel mine at Old Gulch have received the necessary instructions from the Debris Commissioners for the construction of the restraining dam to be built upon the site recently selected by Captain Gillette. Work will be immediately begun.

At the Esmeralda mine some time has been spent in cleaning out the old shaft. This work is about completed and the new management will soon be able to decide upon the plans for development.

Del Norte.

Miner: Work will be resumed at the Coon mountain mines. A representative of the company from Chicago is at the property. All the men that can be obtained hereabouts will be given employment until the ditch is completed.

El Dorado.

(Special Correspondence).—The Two Channel Mining Company, eight miles above Georgetown, has thirty-five men at work. This is a gravel property. Both hydraulic and mill are the modus operandi.

The Josephine mine, an old property near Volcanoville, is being opened by Jacob McCaul. This is a quartz property.

The Landecker, an old-time gravel property of merit four miles south of Placerville, is being reopened on an extensive scale.

At the Gold Note and Philadelphia properties, twenty-five miles east of town, the shaft has reached 215 feet. It is double compartment. At 350 feet it is proposed to run the levels south to the three ore chutes already in the upper tunnels. The ore encountered is high grade and the vein 6 feet. The new steam hoist has a capacity of 1000 feet. A sawmill has been recently completed and is in operation. This is operated by the Septimus Development Company. R. S. Raw is superintendent.

The execution of a bond for two years by Melton & Parlow to Thomas T. Lane of the properties comprising fourteen claims known as the Gentle Annie group is of record. Mr. Lane is preparing to begin active work sinking two new shafts, double compartment, to considerable depth. Mr. E. A. Davis will be placed in charge under Mr. Lane's management. The consideration is $375,000.

It is currently reported that the erection here of an electric power plant within the near future is a certainty. It is reliably stated that the power will be first introduced in one of the mines south of town. The people engaged in the enterprise are men of means.

The tunnel on the Rosebud, twenty miles southeast of Placerville, has reached 120 feet on an 8-foot ledge.

Placerville, September 14, '96.

Kern.

Pick and Pan: The new stamp mill at Garlock has started up. This makes four stamp mills in operation on ore from Randsburg and vicinity. One is situated at Koehn springs, one at Mesquit springs and two at Garlock.

It is reported that the Rameys are closing a deal for the Butte mine with a syndicate of capitalists for $115,000.

Mariposa.

(Special Correspondence).—The rapidly increasing development of Mariposa mines has led to the organization of a company to utilize the waters of the Merced river for the generation of electric power in the Mariposa Electric Power Company, recently incorporated with a capital of $1,000,000. The moving spirit is Captain A. H. Ward, of the Penon Blanco mine. The point on the Merced river in Mariposa county that has been selected for the location of the work is at the Broadhead old dam, about eight miles above Benton Mills, where the new bridge on the road between Bear Valley and Coulterville was erected last year. It is proposed to locate the power plant at the Benton mills and bring the water from Broadhead dam by ditch and flume, a distance of about eight miles, the ditch to be 20 feet wide by from 7 to 8 feet deep. The proposed dam is to be constructed of stone and Portland cement, and to be 85 feet high. The fall at the power-house would be 225 in the clear and the estimated water supply not less than 1000 miners' inches at the driest season, with an unlimited quantity to draw upon while the snow waters are running off from the Summit range. When the river is at its lowest there would be an available supply of not less than 6000 horse power for sale to mine owners in the district.

At the present time the cost of steam power is from $12 to $15 per horse power a month, and as the supply of timber for fuel is each year becoming scarcer, the cost is likely to increase. The company proposes to sell power at from $5 to $6 per horse power per month, cutting the present cost by more than one-half. In addition there would be considerable saving in lighting and in other ways, and consumers in using the electric power would save the cost of firemens' wages, stocks of fuel, boilers, etc.

J. A. Coram, Palmer and other shareholders of the Merced Gold Mining Company are visiting the mines at Coulterville with a view to deciding on future operations. The mill at the Potosi is for the present shut down. Sinking is being continued in the various shafts.

A. G. Briggs, the superintendent of the Tendron mine at Whitlocks, has severed his connection with the Sierra Buttes Company, Ltd. His successor has not yet been appointed.

Augus Mackintosh, who recently bought the Hayseed and Triumph mines at Whitlocks from the Helms, is placing new machinery on the ground. The property will shortly be incorporated and worked on an extended scale.

In Hunter's valley there is more activity in mining matters than there has been for years past. Captain Goodall, of Goodall, Perkins & Co., has begun work on the Barretta mines, which he has bonded for a year. Extensive machinery for prospecting work is being put in position and a considerable number of men will be employed.

J. F. Clapp, the Chicago mining engineer, who acts as consulting engineer for the Selick mine at Haywards, is so satisfied with developments that he has just placed orders in San Francisco for an extensive mining plant.

The Louisiana mine, A. C. Cable superintendent, is now working full blast. Machinery has been in place for some time past, and 30 men are employed in sinking and development work.

B. S. Hill, of the Kohler group of mines, has ordered a complete hoisting and pumping plant for erection at the Coward shaft.

Coulterville, Sept. 15, '96.

Gazette: Goodall, Perkins & Co., who have bonded the Bareta mine in Hunter's valley, are beginning work. Several loads of machinery have arrived in Hunter's valley for the new mines and the work of getting ready for a thorough development of the property is going on.

D. Castagnetto has bonded his ranch to mining men.

Joseph Barrett has bonded his mine in the valley and work on the property will be begun in the near future.

Miner: B. S. Hill, of the Kohler group, is having constructed in San Francisco, a fifty-horse power boiler and a hoisting engine of thirty-horse power for the Coward shaft.

J. J. Casey, of the Riverside mine, on the north side of the Merced river, is taking out some rich ore.

Nevada.

Telegraph: The stopes and drifts of the Gold Hill mine are now above water and in a few days the bottom of the shaft will be reached. The new machinery works well and the new compressed air pumps handle the water easily. Work was commenced Monday morning in the second level north and south and as soon as the water is out new levels will be started. No stoping will be done for the present but the mine will be thoroughly prospected in the lower portions.

Tidings: Dr. A. McMahon of San Jose, and his son, A. McMahon, Jr., are negotiating for the purchase of a 10-stamp mill for the Live Oak and Minuett which has been fully developed. There is upwards of 3000 tons of ore on the dump. The principal ledge is about 5 feet thick, and is said to average $10 per ton.

Placer.

Wm. Rablin is opening a tunnel in the Nary Red district near Colfax to prospect for drift diggings.

Plumas.

National-Bulletin: J. H. Maxwell, Mr. Batchelder and some San Jose people have located two miles of what is supposed to be an extension of the Elizabethtown channel extending from the Vidette claim northwesterly to Hardsock Hill, on the east branch of Feather river. At one point a prospect shaft has been sunk and gravel reached, but water also has been encountered, which probably will make pumping machinery necessary.

Independent: Work on the Verdi placer claim on Mill creek, owned by D. M. Bull, Judge Hayden and John Sparks of Reno, has been temporarily suspended, the old pump having refused duty. Another has been secured and is being put in position. The shaft is down nearly 60 feet.

Santa Barbara

A dispatch says: "The mining notices, for which there has been such a demand, prove to be for use in the San Rafael mountains, about nine miles from Los Olivos, where Peter Montenero has discovered a 16-foot ledge of gold-bearing quartz. People are rushing in to file claims, and 160 acres of land is already covered."

Shasta.

Free Press: A three-foot vein of quartz has been struck in the prospect tunnel on the claim of W. K. Scott and B. Golinsky, who have been searching for an extension of the Uncle Sam mine.

Courier: Captain Taylor and others who own mines at Lower Springs are engaged in systematic work developing quartz mines in that neighborhood.

Murray Brothers, of Redding, are pushing work on the Hull-Murray-Conroy mine, north of town and are now in 200 feet and will run that distance on the ledge both ways.

Searchlight: The National Consolidated Mining Company, operating in the Churntown district, is now putting up a 10-stamp mill, the machinery having been hauled out last week. The mine employs twenty-four men, and when the mill is completed the force will be increased.

Sierra.

Mountain Messenger: Mr. Mead has developed a quartz mine on the county line between Plumas and Sierra, near Mills peak. The ledge is 4 feet wide and prospects well.

At Forest City the South Fork mine tunnel is now in 2300 feet, with gravel above it. The rock is soft at the face. A large dump is about completed to hold some 2000 carloads of gravel. The company expects to put in a small steam engine to haul the gravel cars out of the mine.

The Maple Grove Company will soon begin work running their tunnel. This company is composed of Downieville and Forest business men, principally.

It is reported that the Ruby mine will soon resume operations. It has been one of the dividend mines in Sierra county in years past.

A company of surveyors have been at work on the Black Jack mine, near American Hill, which will soon put on a force of men.

The North Fork Company is still pushing ahead their main tunnel, which is in 2700 feet, with about 150 feet yet to run to pay dirt.

At the Garnett, formerly the North American and Bunker Hill properties, there are at present employed about sixty men. A large part of this force is at work on the outside preparing for the winter. These men are engaged cutting logs for an impounding dam, digging ditches, laying pipe for the hydraulic works and cutting timbers for underground work.

George Warder has lately erected a 2-stamp mill for prospecting at the Crowley mine on the south fork of Scott river. The ledge is very large, but the ore is of a low grade.

Siskiyou.

Journal: Most of the hydraulic mines along Klamath river have been closed down, as their supply of water has given out.

Bailey & Carrick have twelve tons of ore at Lamb's mill from the Katie May mine. The last rock they had crushed was selected rock and went $87 to the ton. They expect this will go full $40 or $50 a ton.

The Nebraska mill on Cherry creek, closed down this week after having crushed about fifty tons of ore. The mill will no doubt be started up again in a few days.

The Horse Creek Mining Company have just made a cleanup, with satisfactory returns to the owners. The gold is coarse, one piece weighing $61.

The Distlehorst & Barton Dredger Company will commence operations at Buckeye bar soon, at a point where good pay has been found by the wing-dam process. The dredger itself has proven a success, as far as its workings are concerned.

Chris Everson has found an excellent prospect on the old Yankee Point channel, just below Oak bar. He believes he has found the old rich channel lost at Yankee Point years ago.

The Culver Mining Company, at the mouth of Barkhouse creek, have resumed their mining operations at that point. With their new pump they will strike bedrock in a short time.

The Edwards Mining Company, on Horse creek, are laying the foundations for an 85-foot dam and sawmill site. It is their intention to work the creek by the elevating process.

Tuolumne.

Union-Democrat: Work has been resumed on the Punter.

The long tunnel being driven along the vein on the Eagle tapped the shaft unexpectedly Monday, and caused a temporary suspension of operations on the Eagle end. The shaft is filled with 600 feet of water.

F. L. Fisher and associates will put up a small hoisting plant on the Never Sweat mine near Groveland for the purpose of prospecting.

The Arbona tunnel will soon tap the ledge.

The Mazeppa has shut down temporarily. It is under bond from W. N. Harris.

Preparations are being made to open up the Alabama mine upon a large scale to Lord Sudley and the other English shareholders, who, when here, were well pleased with the property, which they have bonded.

The company operating the Maccaroni mine under bond near Groveland have just had delivered 30,000 feet of lumber for the new 10-stamp mill and hoist being erected on the claim.

The Argall Bros., who are operating the Slap Jack mine in connection with a San Jose company, tapped a rich chute of ore lately. It is proposed to put in an engine and hoisting plant soon.

Independent: The Confidence mine is contemplating the erection of a 30-stamp mill.

The Rawhide mine will shortly add 60 stamps to its present mill capacity.

Another pocket has been taken out of the Birney & Hudson mine, at Brown's Flat, and yielded $1250.

In the Arbona mine, owned by Stockton parties, last week a large vein was opened up.

The Mountain Lily and Mountain Boy mines, northeast of Columbia, and owned by J. W. Armstrong, have been sold to A. S. Graham of this county and Jacob Schoenfeld and David Adler of San Francisco. These mines are new properties, being discovered less than two years ago.

Trinity.

Journal: Donohue & Co. have struck it rich in the Jim Kelly mine on Donnelly gulch in Deadwood mining district. The ledge at the top of the drift is 2 feet wide and 3 feet wide at the bottom.

The Bonanza quartz mine, near Trinity Center, owned by William Vollmers, Elias Ellery and others, has been bonded to McCloud & Johnson for, it is said, $100,000.

The Copper Queen mine, in the same district, has been bonded by F. L. Dimock, T. J. Baker and Gerald O'Shay to D. B. Hunt of Redding for $10,000. Work will commence at once in sinking a shaft and driving a tunnel.

M. Bretton, a prominent mining man at Minersville, has gone to France for the purpose of interesting French capital in the development of mines in that section.

NEVADA.

Dayton *Times*: There are now in the neighborhood of thirty men working on the Ninety-Four Company's placer ground on the flat at the mouth of Gold canyon. Eight or nine of these are the owners of the ground, and the others are working on leases of portions of the ground, and all are making fair wages. Some very good ground has been found by the company recently, and those working on it are making from $3 to $3.50 per day. The others are making all the way from $1 50 to $3 per day per man. When it is understood that the manner of working this ground is very crude; that the dirt is hoisted from drifts in buckets by man-and-horse power, and washed in the boxes the same as forty years ago, it will be seen that the property is quite a valuable one, which, if it could be operated on a large scale, would no doubt be the best paying piece of property in the county. Efforts have been made and are still being made to bring the attention of capitalists to this property, and it is hoped they will meet with success. There is a vast amount of ground, and it would take years to work it out, even with the most advanced scientific methods of handling it.

At Pioche the Old Timer, which is owned by W. V. Rice of Park City and others, is now affording employment for twenty men. The leaching plant has been overhauled and repaired and is now in good order.

The Yuba is being worked under lease and is making periodical shipments of high-grade ore.

Frank Swindler is working a small force on the Poorman, in which large amounts of low-grade ore were left standing at a time when it was only possible, with the great cost of transportation, to handle the high grades at a small margin.

The Eureka Hill Company has its new well at Homansville down through the wash 260 feet, and struck a large flow of water on bedrock, sufficient for all present milling purposes. They will now start up their full 100-stamp battery which has in part been hung up during the past month for want of water.

A strike of more than usual importance was made in the face of the 1000-foot level of the Gemini lately. This ore body is in virgin ground and demonstrates that the rich ore above, which has made that property famous, continues.

The Centennial Eureka has purchased a water right and mill site near the Warm Springs, between Santaquin and Goshen, and the company has under consideration the erection of a mill plant at that point.

White Pine *News*: A new strike has been made in the Sacramento Pass mine, east of Osceola. Work was begun in the shaft, which was abandoned several weeks ago, the outlook not having been at that time considered favorable; and within four feet of where the work was discontinued a large body of good pay ore was encountered. Several good pay streaks have also been uncovered in the placer diggings.

Eureka *Sentinel*: The Keystone Mining Company has been formed for the purpose of developing gold and silver mines in Roberts creek district, in the west side of the county. The principal mines owned by the company are the Keystone and Odair. An encouraging strike was made in the former recently. They have purchased the reduction works at the old town of Sherwood, or Union, and are arranging to have the engine, furnace, buildings, etc., removed to the neighborhood of their mines.

OREGON.

Democratic Times: In the lower tunnel of Dr. Hinkle's quartz ledge on Sardine creek a vein has been struck showing a width of 2 feet of good ore.

A. W. Sturgis of Forest creek has sold his property to Portland parties. The price paid is $40,000.

Major Newell is preparing to put a 120 H. P. engine at his mine on Rogue river, near Grant's Pass.

The Steamboat mine has been bonded by Captain Nash and W. I. Vawter of Medford,

Charles W. Knowles of Portland and A. M. Crawford of Roseburg, who will endeavor to discover the lost quartz ledge and also the placer channels, which were rich in early days.

Grant's Pass *Observer*: The Gold Basin Company has given up the idea of getting water on their property and are packing the machinery back to Kerby. A large amount of capital was sunk in the venture.

The merchants of Grant's Pass buy from $500 to $800 worth of gold dust per day. The large cleanups are shipped direct to the mint and no record is kept of them.

Bedrock Immortal: At Granite are the La Bellevue mine, with 800 feet of development work; the Red Boy, a steady producer; the Surprise and Ornament mines, with a 3-foot vein of gray copper ore that will go $500 to the ton; the Ibex, with rich ore ready for shipment valued at $50,000 and a 3-foot vein in the face of the tunnel that will go $200 to the ton, and many other properties.

The Salt Lake syndicate owns about twenty miles of placer ground on the north fork of the John Day river, and with the building of large ditches and reservoirs and the operations of the mines employs 100 men, and will continue to do so until winter sets in.

BRITISH COLUMBIA.

Slocan Mining Review: The directors of the Morning Star Company have decided to install first class machinery and pumps at the mine at once and push development work to the 300-foot level.

In Long Camp, T. Shonquest has purchased a half interest in the Denaro Grande for $10,000.

A report comes from Seattle that C. F. Fishback, one of the owners of the Seattle *Times*, has sold to the British Northwest Gold Mining Company property in the Cariboo district for $500,000. The properties are: The Maude Hydraulic Mining Company, 880 acres; Fishback Hydraulic Gold Mining Company, 570 acres; Quesnelle River Gold Mining Syndicate, 20 miles of the main Quesnelle river. It is said the men making the purchase represent J. E. Addicks and E. F. J. Gaynor of New York.

Spokane *Chronicle*: The Columbia and Western Railway Company, operating between Trail and Rossland, is building handsome general offices near the smelter at Trail. As soon as the building is finished, the head office will be removed from Rossland and the road will be operated from Trail. It is not likely that the road will be continued west of Rossland this year.

A syndicate of Eastern capitalists is negotiating for the Iron Horse at a price said to be $150,000. This is the property A. E. Humphreys purchased less than a year ago for $25,000.

The Olive Mining Company, which was capitalized at $20,000,000 for the purpose of working the Volcanic group of claims in the Boundary country, has commenced work on the quarters for the men, which are being built to accommodate 100. It is the intention of the company to keep 40 men steadily at work during the winter.

The Delacola Gold Mining Company has been organized at Rossland under the laws of British Columbia, for the purpose of developing the Delacola, on Monte Cristo mountain.

New Denver *Ledge*: Dr. B. Irving, of Vancouver, has bonded the Neepawa, Baker Fraction and Argenta, on Ten Mile creek, for $48,000.

W. A. Johnston and W. C. Fry of Quesnelle have bought for themselves and Chicago men the Chinese hydraulic claim on Cunningham creek for $16,000, $1000 down.

The Olive Mining Company, organized in Spokane with a capital of $20,000,000, is developing its Volcanic property on Kettle river. There are five claims in the Volcanic group, but the chief showing is on the Volcanic. The whole side of a mountain slipped off in some past age and, it is said, left exposed a body of gold, silver and copper ore 600 feet wide and 3000 feet long. The company has driven one tunnel 340 feet to tap the ore body 1100 feet below the apex and have sunk many shafts to test the ore. Streaks of native copper have been discovered, and the value of the entire mass has been found to be high enough in gold, silver and copper to permit of smelting. Development work will be continued fall and winter, and in the spring a 500-ton matting plant will be erected. It is estimated the average of copper will be 9 per cent.

The following are returns of shipments of bullion, matte and ore from the mines and smelters in southern Kootenay for the week ending September 5th:

BULLION AND MATTE.	Pounds.	Customs Value.
Hall mines smelter, Nelson, matte	78,900	$9,171
Trail smelter	40,305	.....

ORE.	Tons.	Approximate Value.
Slocan Star mine, Sandon	160	$11,511
Idaho mine, Slocan	40	3,000
Alamo mine, Slocan	20	1,500
Wonderful mine	65	5,049
Ruth	65	2,660
Washington mine, Slocan	66	4,818
Goodenough mine, Slocan	12	3,721
Surprise mine, Slocan	17	2,111
R. E. Lee mine, Slocan	14½	1,683
Mile Point mine, Ainsworth	15	1,083
No. 1, Ainsworth	15	2,418
Highlander mine, Ainsworth	13	707
Le Roi mine, Rossland	163	7,550
War Eagle mine, Rossland	23	1,090
Josie, Rossland	20	886
Poorman mine, Ainsworth	17½	830
Total for week	786	$63,596
Total so far for 1896	19,723½	$2,196,723

UTAH.

Salt Lake *Tribune*: Commenting upon the advance in smelting charges at the Germania smelter, Manager Jones says that it had been rendered absolutely necessary as the plant had been sustaining a steady loss and in some instances realized but 50 cents on a ton of ore. The Colorado smelters, he explained, had also been compelled to advance their charges or shut up shop, and while he regretted that such steps were necessary in times like these, it was either that or blow out.

A rich strike has been made in the Watunka group on a fork of Cottonwood canyon of 3½ feet of ore that assays 340 ounces in silver and $14 in gold.

At the Mercur mine the output has reached 240 tons a day, and a better percentage of values is being saved than ever before.

At Tintic, the new hoisting works at the South Swansea are about completed and a new ore house is being built. A strike has been made in the south drift on the 350-foot level, there being a 2-foot vein of solid ore running 67 per cent lead, 114 ounces silver and $4 gold.

Operations at the West Cable were discontinued last week by order of the board of directors. The indications are that the property will be closed down until after the election.

At the North Eureka the drift in the bottom of the shaft is in quartz which runs nearly enough to be pay ore, and its quality is steadily improving.

Shipments for the week were divided as follows: From the Bullion-Beck mine, 30 carloads ore, Bullion Beck mill, 10 carloads concentrates; Centennial Eureka, 8 carloads ore; Ajax, 10 carloads ore, Utah, 5 carloads ore, Sioux mill, 6 carloads concentrates; Four Aces, 1 carload ore; Northern Spy, 5 carloads ore, Dragon Iron mine, 2 carloads ore daily.

George W. Keel has made the first payment and secured possession of the Antelope group of mines at Bingham for Eastern capitalists.

Several placer propositions near Bingham that in days gone by have paid well are being revived, with good prospects.

The Northern Chief is making a 100 ton shipment of ore carrying high in lead and gold—an unusual combination. The chief is yielding some of the best grade that has been produced in the district this season, because of its gold value.

Arrangements are being made for a mill at the Northern Light mine, at Mercur, of 200 tons capacity, although for the present tanks for only fifty tons will be put in. They will continue development work, and as more workings are opened, the number of tanks will be increased.

IDAHO.

The various mining camps around Lake Pend d'Oreille are showing considerable activity.

At Kendrick the placer miners are coming in from the Swamp Creek district, east of there, and bring some fine gold. While this is a new district, the cleanups show rich ground.

MONTANA.

The failure of the First National bank in Helena on Friday will cause the closing down of four mines and one concentrator at Rimini. The mines are the Lee Mountain, Lady Meagher, Lady Washington, Maccauber and Morrison. The mill is the Lee Mountain. All are leased by A. M. Esler and are gold and silver producing properties. Mr. Esler had his money in the bank. He ordered his superintendent to suspend all operations, which will throw out of employment not less than 50 men. The Lee Mountain mine is one of the oldest mines in the State, and at one time was one of the richest.

At Libby the Chicago-Montana Mining Company are driving a 200 foot tunnel on the face of their old one and running a new 150-foot tunnel at the air shaft, are putting a 70-horse power engine and boiler, and building a new office and bunk house. The company employs about 150 men, and ships between 20 and 30 tons of concentrates per day.

WYOMING.

At South Pass, during the past winter, experiments were made with the cyanide process, says an exchange, with the result that when spring opened F. B. Sheldon started a plant below South Pass and worked a dump of tailings, cleaning up something like $14 per ton. The summer's run netted him about $1500 clear; Bryson and Dunphy put four tanks in above Atlantic City, and are working tailings which ran to waste; Huff of Atlantic City purchased the tanks belonging to Sheldon and has them working on a large dump of tailings in Atlantic. J. J. Martin has purchased the tailings at the Carisso mill from Samuel Leckir, and is putting in a cyanide plant. There have been millions of dollars let run to waste during the past twenty-nine years, because there was no method known to science to save the gold.

SOUTH DAKOTA.

Black Hills *Times*: At Galena one hundred men are employed by the Union Hill Company, the largest force being at the Colletta, where a double force of twenty men are engaged. Silver preponderates at the mine, but a good showing of both gold and lead is made. It can no longer be doubted that the future of Galena is assured, and that besides large bodies of silver ore there is also an abundance of good paying pyritic gold ore.

The National shaft on Sugar Loaf mountain is down 190 feet and still in blue trachyte. The contractors receive $12 per foot for sinking, the owners furnishing timbers and power for hoisting and other purposes.

Bids for sinking the Dacey shaft at Ragged Top 100 feet ranged from $8 to $26 per foot. The variation was so great that all were declined. The owners of the property have decided to procure a diamond drill and prospect the lower levels with it.

COLORADO.

Denver *Republican*: The management of the Mollie Gibson has issued a report to the stockholders covering the work of the past 18 months. In a letter from the president of the company accompanying the report, he says that there is a treasury balance of $91,000, speaks of the ore bodies which were cut off in the neighborhood of the sixth level by a complicated system of faulting. The development of the lower levels has not yielded a large amount of ore, and up to the present time the continuation of the main ore body, which produced so much rich ore above the sixth level, has not been found. Irregular and sometimes large bodies of ore have been encountered in the various fault planes, and all indications point to the fact that the main body has been carried down by the faulting to a depth greater than has yet been attained in the workings of the mine. The developments of the last few months in the tenth and eleventh levels north have been encouraging, and it is believed that the main ore body will be found not far from the shaft, just below the twelfth and thirteenth levels. The report shows that during the 18 months the mine shipped 6277 tons of ore which returned 593,310 ounces in silver and 341,356 pounds of lead, the total value of which was $382,492. The average value of the ore per ton in silver was $59.95 and lead 36 cents. Construction and operating expenses footed up $261,765; net cash returns, $293,647; net profit at mine, $31,882.

The report received last week in regard to a rich strike of ore near Silverton turns out to be correct. The find, instead of being on Kendall mountain, was at the head of Whitehead gulch, about five miles from Silverton. The gulch has all been staked off since the find, and many of the claims show up rich in quartz. A shipment will be made from the property soon.

Rasmus Hansen's Mastodon mine is now shipping 25 tons of ore daily, taken from an open cut on the surface. The vein is about 12 feet wide.

In the Esmerelda in Minnie gulch the tunnel has been advanced 80 feet, the pay streak averaging 12 inches in width for the entire distance.

In the Last Hope mine in Ice Lake basin the drift is in 200 feet, and 50 feet from the mouth a winze has been sunk 40 feet. The ore body averages from 6 to 8 feet through and runs from $25 to $30 per ton. Thirty tons are taken out daily.

The Little B and Adams lodes on Sampson are to be worked by a company which has recently been organized in Quincy, Ill. Buildings are to be erected at once, the lumber being now on the ground, and mining operations will continue all winter.

At Cripple Creek the Gold Coin Company is preparing to take up the bonds on the property on Sept. 25, and if it succeeds, a dividend by the St. Rosa company to cover at least half of the $65,000 received by the Gold Coin is expected. Production last month was about $12,500 gross, the mine doing much dead work in the meantime. In September it is expected to have double that amount.

The strike in the May Belle tunnel on the Lawrence townsite is proving to be a great one. The ore has widened out to fully 8 feet and fully 18 inches of it carries sylvanite.

Grant & Hammond are getting into a larger body of ore in their shaft on the north end of the Cariolanus, on Battle, the seam now showing from 16 to 24 inches in width.

The Ironclad is now producing more ore than ever and the grade is much higher.

During August the Elkton produced ore which yielded above freight and smelting charges $44,000. The payroll amounted to $8000, leaving the company $36,000 profit for the month. After the regular dividend of $10,000 is paid the company adds the remainder to the reserve fund, which now aggregates about $83,000. At this rate the mine is promising to pay a dividend of four cents but until the reserve fund has reached $100,000 the company will adhere to its 1 cent a month dividend. In all probability October will see the dividend increased to 2 cents.

Cripple Creek *Mail*: The Independence is now loading five cars of ore daily at Victor of quartz that goes to the smelter and which is understood to be high-grade ore.

The Old Gold Geyser mill on Cripple Creek, south of town, has been started up by the new Geyer Gold Company recently formed in Chicago by Riley & Feree. Thirty tons of ore from the Elkton dump are being treated daily by stamp and plate amalgamation, regrinding and concentration after the California blanket method. The clean-ups have shown a saving of 85 per cent and the company is preparing to handle a higher grade ore than that used in making the preliminary test.

The new machinery on the Legal Tender is nearly completed and will be started soon.

The estimated deficit in the net earnings of the Isabella Company for the month of August, as placed by the company, is between $7000 and $8000. The expenses for August were $17,500.

Another strike is reported from the Christmas mine which exceeds in value anything else ever found in the mine. This time the ore was found in a winze that is being sunk to connect the 175-foot with the 235-foot level.

The Taylor Park Mining Company of Gunnison county is building a 17-mile ditch to their placer ground, of which they own nearly 4000 acres in Taylor park.

Record: The Silver Pick mine, in the Mount Wilson district, closed operations September 3rd. There were about 135 men employed in the mine and mill, and this action by the owners came quite unexpectedly. A report is current that the suspension is a temporary one, and in the course of thirty days the employes of the company will be put to work at their former places and both mine and mill placed under more extensive operations than heretofore.

The management of the Gold King mine and mill have reduced their working force from sixty to eight men.

The Milan mine on Sugar Loaf, formerly owned by Dr. J. L. Bond, has been sold to a London, England, syndicate for $100,000. The first payment has been made and it is expected that the English representatives will be in Boulder shortly to take charge of the property and start it up.

The Pine Shade mine has been started up by Silliman and Potter, the owners.

ARIZONA.

Yuma *Sentinel*: The Golden Dream Company secured the Alcyon, the Yellow Gold and the Golden Dream group of mines, fifteen in all, for $30,000. The same company has purchased the Lottie Frank group, five mines, for $10,000. The new prospecting mill ordered by this company will have a capacity of from 25 to 30 tons in 24 hours.

The Senator Dorsey Company has purchased the Dr. Jayne mines and the English Company placer mines and pumping plant.

An English company have a group of twenty-one mines in the Peacho basin, adjacent to the Goshen mine of the Jayne group, which they will open up when cool weather comes, and for the working of the ores of which they will put up a mill at the Colorado river.

Orb: The second payment on the Tucker mine, near Congress, has been made. The price agreed upon for it is $30,000.

The Arizona Copper Company of Arizona have for years been concentrating in a mill of the ordinary type certain of their siliceous carbonate ores. The product is high and so are the tailings. These they are now leaching with sulphuric acid made in ordinary kilns from their own lump pyrites. This is diluted to 17 Baume before being passed through the tailings, which are delivered to the leaching vats directly from the jigs, and are therefore free from slimes. The coarse tailings—the coarsest being ½ inch in diameter—are deposited in tanks 10x10x6. None of the ores consist of silica and oxide of copper only, and, therefore, more or less alumina, manganese and iron are dissolved, which increases the consumption of acid; but this matters the less, as the roasted pyrites from the kilns are copper bearing and serve as a valuable flux.

At Clifton the copper is precipitated by scrap iron, and the precipitation is effected in revolving barrels, immersed in the copper solvent. The staves of the barrels are made of copper rods, secured at suitable intervals in heavy copper heads, provided with trunnions. Coarse copper cloth covers the barrels. The rapidity of precipitation ensures a precipitate of extreme purity, which is run down in copper bars with the oxidized copper ores from the cupolas. In California there are near Copperopolis and at Spencerville masses of cupriferous pyrites, whose ores have been treated by heap roasting and leaching.

Phœnix *Republican*: Near The Needles, on the Colorado river, there is great activity in gold mining on the river, and in the past few months several good discoveries have been made of decomposed quartz, some of it rich.

LOWER CALIFORNIA.

Lower Californian: At the Viznaga mine the 10-stamp mill will soon be running continuously. In no other mine has there been a shaft put down over 200 feet in the camp and it seems that all that is necessary to develop the camp is more capital to go farther below the surface.

SOUTH AFRICA.

Mining Journal: The possibilities of effecting the contemplated reduction of wages among the boys employed on the mines depends so largely upon the extent to which the supply of labor can be made to exceed the requirements, that it is well to note any definite point from which an extra supply may be obtained. There is a great deal of distress in Swazieland just now, and a movement here, therefore, has been set on foot to induce a large number of boys to come from there to these fields. The addition of a few thousand extra hands thus obtained should go a very long way towards rendering the scheme of reduction of wages practicable, and it is to be hoped that every advantage will be taken of this position, both in the interests of the mines and of the Swazielanders themselves.

By about the end of the year 1897 at least 1500 new stamps will be ready to drop. Most of them are now under order. It is a matter of experience that the average number of Kaffirs required on a mine in full working order can be very closely reckoned on the basis of 15 boys per stamp. Some mines can shift with 13 and 14—others make use of 16 and 17; but 15 is a fair average number. Taking these figures, therefore, it will be found that by the date mentioned no less than 22,500 additional boys will be wanted. An addition or influx of 22,500 to the native population of the Witwatersrand is no inconsiderable proportion. In 1890 there were 14,000 natives employed on these fields. By the end of 1894 this number had risen to 40,888, and the census returns published last week, as analyzed in the *Mining Journal*, indicate an approximate estimate of 75,000 natives for the whole Rand. Thus the conclusion is arrived at that by the end of 1897 the native population will be considerably over 100,000.

The difference between employing 100,000 natives at £3 per month, or under the suggested revision of wages, at an approximate rate of £2 per month, works out at the enormous figure £1,200,000 per annum. This sum can be and should be saved to the shareholders.

It is impossible to predict what the total capital of the companies, working at the particular date referred to, may amount to, but it is fair to conjecture that the saving to shareholders which could be effected would go far towards paying a handsome dividend thereon. If the other reforms already referred to were also to be carried out, it is not too much to say that this saving might easily be doubled.

It would be too much to expect that these benefits should be showered upon the industry all at once, but as even a rock is worn away by the constant dripping of water, so by continual reiteration of the difficulties under which profitable mining, or mining of any sort in fact, is at present conducted, there may be eventual, if only partial relief.

There can, unfortunately, be no doubt that among the natives at present at work there is a feeling of unrest, and that rumors have been circulated which have had a distinctly disquieting effect. It is impossible to trace the origin of these rumors, but that they are acting detrimentally there can be no doubt.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPT. 8, 1896.

567,531.—LAMP HOLDER—W. S. Arnold S. F.
567,442.—SOLDERING MACHINE—Ashley & McDermott. Brookfield, Wash.
567,372.—ALMOND HULLER—J. E. Beach, Routier, Cal.
567,289.—MOLDBOARD FASTENER—W. H. Bodenhamer, Hueneme, Cal.
567,335.—SEED PLANTER—G. W. Doane, Riverside, Cal.
567,464.—BRICK CARRIER—Fulton & Petersen, San Jose, Cal.
567,384.—SEALING METAL BOXES—Gersant & Butifant, London, Eng.
567,386.—DRIER—Hall & Casper, Sacramento, Cal.
567,388.—CAR FENDER—P. Hennessy, S. F.
567,140.—CLEANING ROLLER—W. H. Hooper, Angels, Cal.
567,543.—TRAPEZE—G. J. Kinemann, S. F.
567,244.—HARNESS—C. H. Kooper, Paradise Valley, Nev.
567,397.—TIRE TIGHTENER—G. A. Krohn, Gold Gulch, Cal.
567,349.—TYPE WRITER—A. Matteson, Portland, Or.
567,405.—WRENCH—R McDonald, Magalia, Cal.
567,493.—FARRIER'S KNIFE—F. M. McCartea, San Juan, Cal.
567,403.—BOOK TRIMMER—D. Moon, Walla Walla, Wash.
567,253.—VAPORIZER—J. Pratt, Monrovia, Cal.
567,553.—FIRE ESCAPE—E. Riley, Spokane, Wash.
567,421.—CLASP—Thomson & Drever, S. F.
567,522.—CHEESE MAKING—W. M. Turner, Woodland, Cal.
567,430.—BICYCLE FRAME—S. M. Williams, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE FRAME.—Sylvester M. Williams, San Francisco. No. 567,430. Dated September 8, 1896. The object of this construction of frame is to avoid by its elasticity the jars and shocks attendant upon the use of a rigid frame. The frame is composed of spring or elastic bars, bent or returned upon themselves, having connections at their extremities with the stem of the front wheel fork, connections at their rear lower portions with the axle of the rear wheel, a saddle post bar extending from the upper member of the bent frame to the lower member thereof, and transverse journals on the upper and lower members of the frame to which said bar is connected, whereby the frame is permitted to freely yield.

COMBINED ALMOND HULLER AND SEPARATOR.—James E. Beach, Routier Station, Cal. No. 567,372. Dated Sept. 8, 1896. This invention relates to an apparatus for cleaning, hulling and separating almonds. It consists of a frame, a feed hopper supported thereon, a cleaning cylinder having the periphery formed of spirally coiled wires with interstices for the escape of the dirt, a hulling device, consisting of a stationary and a rotary cone adjustable with relation with each other to increase or diminish the space between them, said cones having an elastic peripheral screen coverings between which the almonds are caused to pass from end to end, an opening at the upper end thereof into which the almonds are delivered from the cleaning cylinder, a separating cylinder formed in sections having the peripheral surface of plain and corrugated wires wound about it and connecting belts and pulleys whereby motion may be imparted to rotate the cylinders.

TIRE TIGHTENER.—Gustav A. Krohn, Gold Gulch, Cal. Assignor of one-fourth to Charles Melvin and Duncan McLellan, same place. No. 567,397. Dated Sept. 8, 1896. This invention relates to a device for tightening the iron tires upon wooden and other wheels when they become slack or loose without changing or disturbing the other parts of the wheel itself, so as to either loosen the spokes in the fellies or change the dish of the wheels, or otherwise affect it. It consists essentially in having the separated ends of the felly with the upper faces recessed, perforated metal plates fitting against the felly ends, a right and left threaded screw with reduced ends forming channels which are turnable in the perforations of the plates, and shoulders which abut against the plates forming a rigid connection to prevent the approach of the felly ends, a tire having separated ends, with a groove formed in one of the ends, and a corresponding tongue fitted therein from the other, depending plates secured to the tire and enclosing the sides only of the felly ends and movable with the tire, plates secured to the under side of the tire ends adapted to fit the recessed portion of the felly sections with nuts through which the screw passes, and bolts for securing the felly.

STREET CAR FENDER.—Patrick Hennessy, San Francisco, Cal. No. 567,388. Dated Sept. 8, 1896. The object of this invention is to provide means for picking up automatically and safely an obstructing body so that it will not be dragged or rolled, but will be raised and carried securely and without material injury. The fender consists essentially of a swinging guard or apron and a lever slidably mounted on the car and so connected with the guard that the contact of an obstructing body will cause the lever to contact with the ground, and said lever will be held while the car continues its movement and the guard will thereby be moved into its carrying position. A latch is provided for holding the lever normally out of contact with the ground, and suitable connections are used between the latch and the guard or apron whereby the contact of the obstructing body will trip the latch. Means are also provided whereby the lever is automatically relieved from contact with the ground when its function is completed. In connection with the main apron or guard, there are swinging side guards or wings and suitable connections whereby the latter are swung upwardly at proper times to confine the body within the main guard. The main guard consists of forwardly projecting separated bars provided with intervening means whereby the obstructing body, when cut, is prevented from falling through between the bars. There is also connected with the main guard a projectable sliding guard, and means for automatically projecting said sliding guard beyond the main guard. There are also fingers slidable upon the extremities of the main frame bars, said fingers being spring-controlled and having joints by which they are adapted to yield in all necessary directions.

DRIER.—Wm. J. Hall and Joseph W. Casper, Sacramento, Cal. No. 567,386. Dated Sept. 8, 1896. This invention belongs to that class of driers in which a foraminous or screen cylinder containing the material to be dried rotates within a chamber and is subjected to heated air therein, though the device may be used for the drying or curing of any material to which it is adapted. The special object in view is to provide a simple and effective machine or apparatus for drying and curing hops. The drier comprises a tight chamber or compartment having an air inlet and an exhaust stack for inducing a current, concentrating rotating screen cylinders mounted within the chamber or compartment, the outer cylinder being adapted to receive the material to be dried, and one end of the inner cylinder communicating with the exhaust stack, open-topped casings in the lower portion of which the air is admitted, and independent heaters in said casings for heating the air as it passes to the cylinders. There are also gates controlling the admission of air and vertically disposed steam pipes in said casings for heating the air as it passes to the cylinders. There is also a steam pipe leading into the vent stack and a perforated steam connected pipe within the compartment for admitting moisture as required

Coast Industrial Notes.

—The California Navigation and Improvement Company contemplates having built two fast boats to ply between this city and Stockton.

—At Ensenada, Lower California, a water system is to be built to supply the city with 200 inches of water from the San Antonio range. The Governor has placed the labor of 100 soldiers at the disposal of the engineer.

—The Board of Supervisors of Sacramento county has agreed to advertise jointly with the Supervisors of El Dorado county for the construction of a new steel bridge across the south fork of the American river, between Sacramento and El Dorado counties, near Mormon island.

—The Union Iron Works has secured from the United States Government a contract to build a new battleship for $2,675,000. She will be larger than the Oregon and similar to the Kearsarge and Iowa. The following are her dimensions: Length on load water line, 368 feet; molded beam, 72 feet; mean draft in normal displacement, 23 feet 6 inches; normal displacement, 11,500 tons; total displacement, 12,500 tons; total coal capacity, 1,200 tons; horse power, 12,000; speed, 16 knots per hour; belt armor, 6½ inches thick, 7 feet 6 inches deep; transverse armor, 12 inches; barbette armor, 15 inches; turrets, 17 inches; top of turrets, 5½ inches; protective deck, flat, 2¾ inches; protective deck, slopes, 5 inches. The battery will consist of four thirteen-inch rifled guns, fourteen six-inch rapid-fire guns, six six-pounders, four one-pounders, four machine guns and one field piece. The ship will carry 200 rounds of ammunition for the thirteen-inch rifles, 2,600 rounds for the six-inch rapid-fire guns, 10,000 rounds for the six-pounders and 2,400 rounds for the one-pounders. She will also carry four broadside torpedoes and display four searchlights.

Recently Declared Mining Dividends.

Galena, Utah, $5000, payable September 20th; a total of $51,000.

Utah of Utah, $2000, payable September 20th; a total of $171,000.

Bullion-Beck Mining Company of Utah, $30,000, payable September 20th.

Portland Gold Mining Company, Colorado, $30,000, payable September 15th.

Personal.

JAMES D. HAGUE is in New York.

M. BRETTON, of Minersville, Trinity county, has gone to France to interest French capital in the development of mines in that district.

LUDWIG KLOZ, who has been superintendent of the El Paso smelting works, and was formerly at Leadville, has been appointed assistant metallurgist at the Broken Hill mines in Australia, upon the recommendation of Superintendent Ropp of the Selby smelting works. The chief metallurgist at Broken Hill, W. Koehler, is also an American.

Obituary.

W. S. MILLS, at one time manager of the Southwestern Mining Company of El Dorado canyon, Lincoln county, Nevada, died September 4th, at his home in Los Gatos, aged 76.

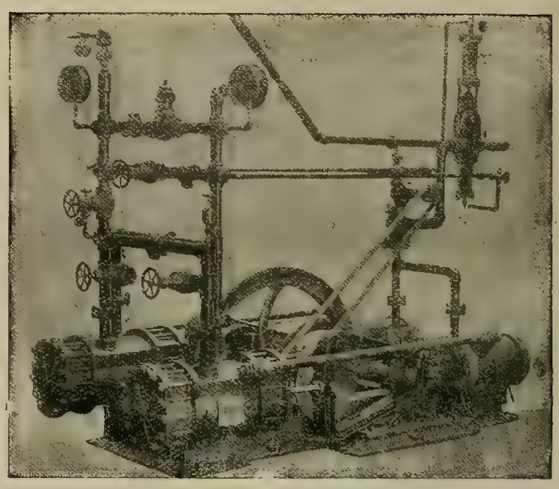
DOUBLE PIPE AIR COMPRESSOR.

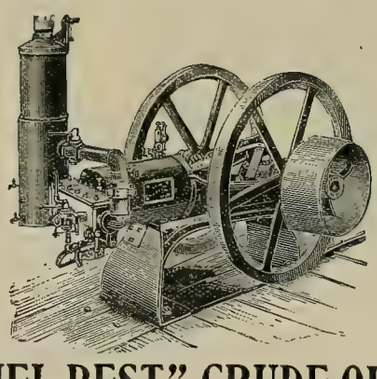


This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING



THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 3⅜ gallons @ 14c.	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c.	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

MANUFACTURERS OF

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight. About 5000 Pounds.

It requires no belting, shafting, pulleys or building.

Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.

Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S.F.**

WHY THE SPRINGER CONCENTRATOR IS THE BEST.

It will do more and cleaner work than any Rubber belt machine.
It weighs only one-half as much as some of the other six-foot Concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any.
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer Concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other Concentrators.

I. S. Van Winkle & Co., 413 Market St.

SAN FRANCISCO, May 27, 1896.

DEAR SIRS:—In a letter just received from our Superintendent, Mr. Trowbridge, he says, referring to your Concentrator: "The new Springer Concentrator is fulfilling every expectation. A few minor points may be improved upon, but in its main features it is almost perfect. I shall write more fully after further work." Yours very truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

Extract from Letter of W. S. Trowbridge, Superintendent Bald Eagle Mining Co. June 20, 1896.

"We work twenty tons of ore per day and size out all coarse portion after it has been worked over two other machines, and run all the slimes and finer portions over your machine. I think it would easily handle twice the quantity. It is certainly doing splendid work now, in a difficult place. I believe the belt will wear indefinitely."

July 12, 1896.

Ship us by steamer another six-foot Canvas Belt Springer Ore Concentrator and have the new Rubber Flange attachment, and put a rawhide belt on wheel. Yours truly. W. H. PAYSON,
Secretary Bald Eagle Mining Co.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 17, 1896.

General business holds up well, with a steady increase in the volume of goods going out, notwithstanding the retail trade being in as small quantities as possible, not knowing what influence the election in November will have on trade and finance. This conservatism prevails over the coast, and, so far as reports go, throughout the United States, which would indicate that the future has been discounted and the expected will not take place. The gold mining industry does not appear to be affected, for the inquiry for good propositions continues fair. The trouble now is that owners ask too much money, which is against their selling. Manufacturers report a continued good business in all branches of that industry. The almost certainty that the Union Iron Works will get a contract to build one of the new battleships is quite a favorable factor with us. This means more men to be put to work and increased consumption of iron, copper, etc.

The local money market is essentially unchanged. There is continued hoarding of money but the banks are not only meeting all demands but are accumulating funds. Collections are reported to be free which greatly eases the general situation. The advancing markets for wheat is a very important factor for the more farmers get for their produce the better it is for the country at large, particularly on this coast, where such a surplus of wheat is harvested each year. The money markets at the East are shaping more in the interest of borrowers owing to continued heavy importation of gold. It is the impression now that the imports of this country this year will aggregate over $60,000,000 owing to higher prices for grain and improved foreign demand for cereals, provisions, machinery and cotton. In England the rates of interest are higher and strong at the advance. This is largely due to the demand for gold for America, Austria-Hungary and Russia, and also an improvement in general business.

New York Silver Prices.

NEW YORK, Sept. 17.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	30⅜	65⅞
Saturday	30 3-16	65
Monday	30	64¾
Tuesday	30	64¾
Wednesday	30¼	65⅛
Thursday	30⅜	65⅜

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 77½	10 25@12 50	13 15
Saturday	10 75	2 77½	10 25@12 50	13 15
Monday	10 75	2 80½	10 25@12 50	13 05
Tuesday	10 75	2 80	10 25@12 50	13 05
Wednesday	10 75	2 80	10 25@12 50	13 10

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, glit edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	10
New York Telegraphic Transfer	15
London Bankers' 60 days	$4.83
London Merchants	$4.82
London Sight Bankers	$4.85
Refined Silver, peroz., 1000 fine	65¾
Mexican Dollars	50½@51½

SILVER.—The market continued to ease off in Europe and at the East up to Wednesday when it began to strengthen. The shipments from New York to Europe are on a liberal scale which is considered a favorable sign for better prices as the production is not increasing and the demand seems to be increasing abroad. At the East there is more dealing in silver certificates with the general sentiment on the bear side. On September 11, the Mercantile Safe Deposit Co. held 1,652,496 ounces of silver against which 1652 certificates, or about the full amount, have been issued. It is stated that considerable of these have been loaned to short sellers.

Under the present laws the Government distributes standard dollars in multiples of $500 and subsidiary silver coin in multiples of $200 free of expense to parties desiring the same in exchange for lawful money deposited at the office of any Assistant United States Treasurer. During the past four months Assistant Treasurer Berry of San Francisco has sent out of the City all over the coast silver coin free of expense as follows:

	Silver Dollars.	Subsidiary Silver.
In May	$101,306	$51,250
In June	125,500	89,870
In July	260,500	76,650
In August	199,000	106,295

MEXICAN DOLLARS.—The market is dull and lower. The export inquiry is slack. At New York there is a fair export movement.

COPPER.—The market has held steady. Eastern and European advices are more favorable for an increased consumption. Both abroad and at the East there is an absence of any speculative inquiry. The offerings are made more sparingly.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@17

ANTIMONY.—The demand is fair, with the market steady at 7¾@8⅛c in a jobbing way. New York mail advices quote 7⅜ for Cookson's, 6⅝c for Hallett's and 6½c for Japanese, from store.

BORAX.—There is nothing new to report. The market is quoted as follows:

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	5¼
Concentrated, "	5⅝

QUICKSILVER.—There is a continued fair demand for both export and home.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

LEAD.—The market has strengthened at home and abroad. The demand at the East has enlarged.

Our market is quoted as follows:

Pig	—	@	3 65
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

SHOT.—The demand is increasing. Stronger prices for lead makes shot firmer.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The decline in silver has caused pig to ease off, owing to consumers holding off, besides, the bulk of the season's demand is over.

The market is quoted as follows in jobbing lots:

Pig, per lb	14
Plate, I C coke, heavy, per box	$4 10@ —
" " " light, "	4 00@ —

POWDER.—The demand continues exceptionally free. There is nothing to warrant higher prices.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, "	8½c

IRON.—The market is steadier. Eastern advices are to the effect that large quantities have been taken up by speculators and large consumers, who believe that better prices will rule before long.

Our market is quoted as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50
Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c	
Lake Superior Sheathing		20

COAL.—Both dealers and importers look for low prices throughout the winter. The advance in wheat will send more ships loaded with coal to this port. The demand from consumers is increasing.

SPOT FROM YARD—PER TON.

Wellington	$7 50@ 8 00
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 00@ 5 50
Coos Bay	— —@ 4 50
Cannel	— —@ 8 50
Egg, hard	— —@11 50
Wallsend	— —@ 7 00
Scotch Splint	— —@ 7 50
Brymbo	— —@ 7 50

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—The demand is dull for home and fair for export.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is barely steady.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Sept. 17, 1896.

The market ruled quiet and dull with an easy tone up to yesterday, when there was a firmer feeling in the middle and north end shares. The improved tone seems to be somewhat on the surface, that is, there is absolutely nothing to warrant it outside of a prospective gamble for better prices on the work going on in several of the mines, more particularly on the Brunswick lode. The Comstock lode, except to the west, has been largely honey-combed and therefore the chances for finding a big body of good ore is rather slim, but the Brunswick lode is an unknown quantity and therefore there are chances of finding quite a body of ore. This makes the shares of the mines on that lode more of a gamble. The west workings on the Comstock will take time and the expenditure of considerable money to find the west lode, and after struck, it will take a still longer time to develop it so as to take out the ore. That there is ore to the west is not doubted by the better informed mining men and it looks as if the management of Con. Virginia and Ophir have determined to find if there is. Several mines on the west lode were worked years ago and two or three proved quite rich, but owing to their not being able to handle the water that came in work had to be suspended. Since then several long west crossdrifts have been run and it is not at all unreasonable to assert that the west lode has been drained to a considerable depth. When work is started to the west at several points and in right good earnest then the shares of the Comstock mines will be quite a gamble; as they now are the moves up and down are largely on short sellers with some outside buying, for, so far as our advices go, the management of the mines do not expect to find much ore, not enough to raise the market to any great extent. What is to be reported found will be more for the purpose of selling shares so as to collect assessments already paid by manipulators and also those levied and to be levied.

From Virginia City our advices regarding work on the Comstock lode are of rather an uninteresting character. Everything points to time and considerable work before anything of a positive character can be determined, but while the work is progressing some ore is liable to be run into. In Utah, Sierra Nevada and Union the work is in the same levels and direction publishsd last week. Some mining men are watching that under way in one of these mines with considerable interest. In Mexican, Ophir and Con. Virginia work is being pushed to the west on the 1000-foot level. In the two former they are liable to start exploiting work before long. On the Central tunnel level in Ophir they are still at work, with the ore showing a slight improvement, but too low grade to extract. In Con. Virginia interest in the work to the east on the 1650-foot level seems to have died out. They raised 122 tons of ore last week which assayed over $36 a ton. After paying all expenses for August the company had over $17,000 in cash. This will meet the September expenses. In Gould & Curry and Best & Belcher the work is still to the east. Work has been suspended in Savage for two weeks so as to make some needed repairs. From Hale & Norcross the news from the 900-foot level continues favorable. They are getting ready for more active work on the 1100-foot level. Chollar raised less tons of ore last week. The assay was lower. Work was still being done on the 450-foot level. In Potosi at date of last advices some needed repairs were being done. It is reported that in the Bullion long crossdrift the formation is more favorable. From Alpha, Con. Imperial and Challenge nothing new comes to hand. Confidence did not extract any ore the past week. Now that Yellow Jacket is assessed more men ought to be put to work. It is not at all likely that anything of consequence will be done at that end until outsiders sell more shares and Kentuck treasury stock is disposed of. In Crown Point active work is under way at several points. Ore assaying $7 to $11 a ton gold is reported struck. Belcher raised 65 tons of ore the past week and Seg. Belcher about 20 tons. The ore was fair grade only. Overman is still taking out a few tons of ore each week. The Alta letter is uninteresting—perhaps shares are wanted by the management, as another assessment has been levied.

Interest in the work on the Brunswick lode centers largely on the Chollar-Hale & Norcross 400-foot south drift. By Saturday this drift will be extended fully 100 feet from the shaft station, and it is only 120 feet from the station they expect to cut the downward continuation of the ore found on the 300-foot level. If there is an improvement the shares will probably sell for more money, to make shorts fill and sell some stock, but if the showing is poorer, then for less money. While this drift is being run, the shares in Chollar and Potosi will be a gamble. In Occidental, some ore is being milled. It assays around $13 a ton. The work in this mine, Hale & Norcross, Savage, Gould & Curry and Best & Belcher is of the same character reported last week.

From the Bodie district the news is unimportant. Considerable work is being done in Standard, Bodie and Bulwer. These mines appear to be run as a business proposition and not as a gamble in shares.

From the Silver King, Arizona, an improvement comes to hand.

The following illustrates the changes of the week:

MINES.	Sept. 10.	Sept. 17.
Alpha	$ 17	$ 17
Alta Consolidated	07	.....
Andes	.....	.....
Belcher	59	52

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above intereating book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

FOR SALE.

ONE KNOWLES VERTICAL SINKING PUMP.

Capacity, 12,000 gallons per hour; in perfect order. Will sell at half price. Address
P. ODERMATT, Boiler Works,
58 & 60 Bluxome Street, San Francisco.

FOR SALE CHEAP.

8x12 Wheeler Rock Crusher; 10 H. P. Ames Portable Engine; 5 H. P. Upright Boiler and Engine. All in Perfect Order.
RILEY, 1202 Mission Street, San Francisco.

SITUATION WANTED by an experienced amalgamator and millman who thoroughly understands his business. References furnished. Address ALEX. H. FORMAN, this office.

Assessment Notices.

ANCHOR COAL AND DEVELOPMENT COMPANY. Location of principal place of business, San Francisco, California; location of works, Kelso, Cowlitz county, Washington.

Notice is hereby given that at a meeting of the Board of Directors held on the 24th day of August, 1896, an assessment No. 5 of Three Cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market Street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on SATURDAY, the twenty-fourth (24th) day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office, No. 632 Market Street, Room 5, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of September, 1896, an assessment (No. 79) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth (5th) day of October, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of October, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 2d day of September, 1896, an assessment (No. 24) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada block, No. 309 Montgomery streg, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of October, 1896, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 29th day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

ANNUAL MEETING.—The Annual Meeting of the stockholders of the Anchor Coal and Development Company will be held at the office of the Company, No. 632 Market St., room 5, San Francisco, California, on TUESDAY, the 20th day of October, 1896, at 1 o'clock P. M., for the purpose of electing a Board of Directors for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, October 17th, at 12 o'clock M.

E. D. FARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. H. Leek, in the Miocene mine, near Crescent Mills, Plumas Co., to deposit tailings in Rush creek; from Hugh Craig, in the Casajo mine, near West Point, Calaveras Co., to deposit tailings in the middle fork of the Mokelumne river; and from John Faubel, in the Mad Mule mine, near Stella, Shasta Co., to deposit tailings on the bank of Whisky creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on September 21, 1896, at 1:30 P. M.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. An Advance in Gravel Mining.

With the increased interest in quartz mining the world over, there has been a general revival of hydraulic mining. This is not so noticeable in California, owing to the debris question, as it is in the rest of the globe; yet the mining world to-day still looks to California for the best methods of working gravel and uses the systems built up before the debris question arose, which remain to-day the standard the world over. As in quartz mining, the main improvements in hydraulic mining now are in the direction of the reduction of the cost of working. There is, doubtless, many times as much auriferous gravel in the world that will not pay to work as of gravel that will pay with present known methods. Naturally, any improvement in methods that will reduce the cost of handling gravel will result in the opening up of many mines now lying idle. An invention that will reduce the cost of working even a small fraction of a cent per cubic yard or increase the service of a miners' inch of water by a small fraction, will open much gravel that cannot now be worked to a profit. There is a great inducement offered for effort in this direction. Outside of California there are many large fields for operation in gravel; for example: Siberia, New Zealand, Spain, British Columbia, Colorado, Idaho and Wyoming.

In Idaho, Wyoming and Colorado, especially, there has been a great deal of activity within the last six months. Very little of the gravel in these States is of high grade and a large proportion of it must be worked with hydraulic elevators, owing to an insufficiency of dump.

Since the closing down of the hydraulic mines in California there has been considerable work done along the rivers with hydraulic elevators. This system of mining is sure to play a very important part in the working of gravels in other parts of the world. All the energies of those engaged in this class of mining have been toward increasing the service of the water. A large proportion of the water is required for washing down to the pits. It is well known that the water in the elevators themselves will lift all the gravel that can be gotten into the elevator, and the question has been how to supply the largest amount of gravel.

There has been invented a new form of hydraulic elevator, herewith illustrated, which, with the use of an auxiliary feed, will enable a larger amount of gravel to be supplied to the elevator. The result will be an increase in the service of the water available in any mine worked under this system, and a large decrease in the cost per cubic yard of handling gravel. It is an invention of George H. Evans, general manager of the Golden Feather mines in Butte county, and promises to do much for that class of mining.

We present two cuts, one representing the improvement referred to in the Evans hydraulic elevator (see page 256), and the other showing a scene on the Golden Feather property in Butte county, where it is in operation. The principal features of the elevator are the three suctions, one main and two auxiliary, the two auxiliary allow the water and material to enter at the back of the seat, thus reducing the wear and tear on machine. It is the auxiliary opening that increases the efficiency of the elevator by allowing the proper proportion of air to enter with the water and material, even when main suction opening is choked.

The auxiliary suction openings can be extended with any size pipe to any distance beyond the elevator proper, and be used for draining places in the bedrock below the line of sluices connecting with elevator. This is a great advantage and can be carried on without interfering with the sluicing of material to main opening in elevator seat. This elevator, it is claimed, will show from 20 to 30 per cent greater efficiency than elevators heretofore used, as has been proved by the operations at the Golden Feather channel, where a number of them are in operation.

Another point in its favor is, that it is not necessary to sink a shaft to bedrock to place the machine in position to work. They are easily manipulated, and so light that they will sink their own pits, thereby avoiding not only a loss of time, but the great expense of sinking and pumping in wet ground. The usual way of setting the elevators is to fit them together on the bank and lower them into position, two men doing all the work necessary. All the joints on the elevators are made with revolving flanges, which, with taper rings, will make any adjustment necessary for rapid connection.

GIANT AND ELEVATOR IN OPERATION AT THE GOLDEN FEATHER.

In placing two of the 16-inch elevators in position at the Golden Feather this year, they were fitted up, lowered to the bottom of river, and working (each throwing 18,000,000 gallons per twenty-four hours) within twelve hours. All the excavating necessary to be done was a space of four square feet. In placing one of the old style elevators last year, it was necessary to have divers place them in position, and an excavation of 128 square feet was required. There is no necessity to use water elevators in connection with this system of elevating, as one of the auxiliary suctions will take care of all the water in the pit.

They are made of cast iron or of steel, the only difference between them being in the weight, those of steel being lighter and more easily handled, and may be made in sections weighing not more than 190 pounds, suitable for mule transportation. They weigh considerably less than the old-style machines.

At the Golden Feather mines they elevate gravel 15 feet with 100 feet of pressure, and in two cases they have elevated to a height of 52 feet with 250 feet pressure. With a 2¾-inch jet there was elevated all the water from a 2½-inch giant with the same head, together with all the gravel and sand it was possible to pipe down the sluice with a grade of 3 inches to 12 feet. In the last instance, only 400 inches of water was used for both elevator and giant, and 2400 tons of material were elevated daily. The elevator was of cast iron and lasted three years. At the Golden

TABLE OF CONTENTS.

ILLUSTRATIONS.—Giant and Elevator in Operation at the Golden Feather, 253. Evans Hydraulic Gravel Elevator, 256. The Jeffrey Mine Pump, 259.

EDITORIAL.—An Advance in Gravel Mining, 253. A Secretary of Mines; The Mines and Home Markets; Abandonment and Relocation; The State Mineralogists' Report, 254.

SCIENTIFIC PROGRESS.—The Utility of Inventions; The Electric Furnace; The Manufacture of Hard Steels; The Geology of California; A Pair of Scales Discovered While Excavating Near Thebes; A Gas Exposition to be Held; To Attempt Getting to the Top of Aconcagua, 259.

MECHANICAL PROGRESS.—The Jeffrey Mine Pump; German Export Trade in Barb Wire to Japan, 259.

ELECTRICAL PROGRESS.—Development of Electricity as Motive Power; Electric Headlights on Locomotives; An Electric Trolley Railway Between New York and Philadelphia, 259.

PRACTICAL INFORMATION.—Proposed Polar Exploration; The First Railroad in Korea; The Birth Rate in the United States; Pumice Stone; A Terrible Hailstorm; Nausea in the Brain; Paraffine; A Monument to John and Sebastian Cabot; Elephants in Africa, 260.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 262-63.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 270.

MISCELLANEOUS.—Concentrates, 255. Gold Deposits in Nicaragua; Improved Processes for Reducing and Saving Precious Metals, 256. To Sink a Shaft One Mile; Gold Mining in California, 257. The Cyanide Process at the Utica Mine, 258. Coast Industrial Notes; Personal; Recent Patents; Notices of Recent Patents; Recently Declared Mining Dividends; Recent Mining Incorporations; Commercial Paragraphs, 261.

Abandonment and Relocation.

In cases where applications are made for mineral land at the United States land offices it often happens that the applicants take no further steps to secure their patents beyond surveying and publishing the applications. Where this same ground is relocated after abandonment, and after failure to do the necessary required assessment work, the relocators, upon filing their applications, are placed to the necessity of proving abandonment. This, it seems, works an unnecessary hardship. Now the new owner must go into court and prove that the claim was abandoned by the original locator and applicant. It seems that the present law does not designate any time after the publication of the notice within which the applicant must make entry, but can do so years afterwards at his leisure. It is reported that the land department will shortly issue an order notifying all applicants to make entry of their claims within a reasonable time after publication, otherwise all proceeding will be declared void.

The Mines and Home Markets.

The Baker City *Bedrock Democrat* says that there is not another city in the West where the people have enjoyed such unwavering prosperity during the panicy times as Baker City, and attributes this largely to the mines of Southern Oregon. These mines have made a home market for agricultural and other products of that part of the State. More than that, there money is kept at home and in circulation, and any stringency in the money markets of the outside world is not felt. Much the same may be said of Scott valley, in Siskiyou county. There is claimed to be more wealth in that fertile little valley per inhabitant than in any other part of California. Its lands are exceptionally rich and the climate guarantees certain crops. Yet there is no rail communication with the outside world through which to carry the products to the larger markets, and this is not necessary, for in the mountains of northern Trinity and over on the Salmon river, and in other parts of Siskiyou, the farmers of Scott valley have for more than a generation found a market among the miners for their products. The producer and consumer, too, come into almost direct communication without the intercession of middle men.

There can be no better way of building up a home market for California products than through the opening up of our mines, and for this reason the farmers of this State should look with favor upon any steps proposed for the betterment of the mining industry.

The State Mineralogist's Report.

The thirteenth report of the State Mining Bureau has been filed at Sacramento and will be printed and ready for publication about the first of December. Mr. Crawford, the State Mineralogist, has wisely led the work of the bureau into lines in which, with the present organization, it could do most good. The result is shown in the way of papers of practical value on special subjects. Naturally much of the report is taken up with statistics, and which of necessity the State must publish.

Mr. Crawford suggests that the bureau should be placed on a permanent basis as to funds, like the State University, in order to produce work of a superior character. As long as it leads an ephemeral life, existing from Legislature to Legislature, it is impossible to take up certain lines of scientific work that the character of the institution demands. This has been especially noticeable in the geological work that has been done by the State in the past. Good men cannot be engaged without a certainty of employment. More than that, many changes of men have led to many changes in methods, resulting in a large loss of money and in a great deal of confusion in the work itself. However, the experience of the future in the geological work done by the State of California will be much like what it has been in the past, unless some change can be brought about in the method of the appointment of the men who carry it on. As long as the appointment of these men remains in the hands of the Governor, they may be changed with every administration. With every change will come a change in the methods of the work that will lead to confusion, loss of money and a failure to accomplish satisfactory results.

Mr. Crawford makes a suggestion as to the future work of the bureau that will commend itself to all who are interested in the bureau, and that is the separation into two departments of the mining and the geological work. On this he says:

"It has been felt, however, for some time that, as the bureau is organized, neither the mining work nor that in geology can be carried on to best advantage together and by the same assistants. The work in mining, with the growing details of the present day, needs men especially trained in all the aspects of that important industry. So it is, also, with the lines of geological investigation. The time was when the science was much less complicated, and a man could be an expert not only in all the problems then connected with mining, but also a practical geologist. Now, the best results can only be reached by men trained each in his own special line, and while the two subjects of geology and mining are, in certain aspects, intimately related, yet in others they are widely separated.

"Consequently it has been thought best to recommend, for the fullest efficiency of the State Mining Bureau, that the work of mining proper be separated from that of geology. That the former be devoted mainly to the examination of mines and the gathering of statistics relating to them. In this work only the most experienced assistants—mine inspectors—should be employed, and given power by law to enter all mines, report upon their condition, and enforce, where needed, better and safer working methods. This would prove a direct benefit and safety to the working miner and a protection to the stockholder and investor.

"It is proposed that the work in geology be organized in the form of a geological survey, as a department of the Mining Bureau and have an experienced geologist in charge. * * * The scope of the geological survey must be broad in order to secure the most important economic returns, and should embrace the following main lines of investigation:

"1. The preparation of a topographical contour map in the form of atlas sheets, to be carried on in connection with the United States Geological Survey. * * *

"2. Mapping of geological formations in important local areas, finally spreading over the whole State not covered by the United States Geological Survey. * * *

"3. Systematic collection of representative specimens of the mineral and rocks of different formations in the districts explored. With but slight extra expense duplicate collections can be made for the high schools of the State, a course which would be of great educational value.

"4. A study of building stones.

"5. A description of mineral springs and analysis of waters.

"6. Dissemination of the principles of geology and mineralogy among the people of California, especially prospectors and investors."

Mr. Crawford's suggestion that the State Geological Survey should work on the same lines as the United States Geological Survey, we do not think a good one. It is true, as he says, that the publication of the topographical maps of the United States Geological Survey is very slow and that they are not published for general circulation. The latter objection can easily be remedied. The former objection will hardly lie, because, before the State Geological Survey would be able to cover the ground already mapped by the United States Topographical Corps, they would have other maps out and keep the State surveyors at work for years to come. We see no reason why the State should pay for doing work that is being done by the United States Geological Survey and being done so well.

The work of the United States Geological Survey naturally is on broad lines. Their work should be filled in in detail by the State. However, there need be no trouble about arranging to co-operate with the United States Geological Survey in the work, provided the State Geological Survey is conducted by men fitted for the work. Under the present political system of appointment it is no likely that such men will be obtained and it is not likely that the United States Geological Survey will be willing to co-operate with them.

Among the papers on special subjects are "Ore Deposits With Special Reference to the Mother Lode," by Harold W. Fairbanks; "Water Power and Compressed Air Transmission," by Arthur De Wait Foote; "Preservation of Mine Timbers," by John D. Isaacs; "The Sampling and Measuring of Ore Bodies and Mine Examinations," by Edward B. Kirby; "Comstock Ore Sampling," by John D. McGillivray; "Electric Power Transmission Plants in California," by W. F. C. Hassen; "Petroleum, Its Origin in California, etc.," by F. Salathe Ph.D.

A Secretary of Mines.

Last June we suggested the advisability of establishing a Department of Mines under the Federal Government at Washington. The editorial written then has borne fruit. In our issue of the 12th the secretary of the California Miners' Association suggested that that Association take steps toward establishing such a bureau. In a late issue the Spokane *Chronicle* says, in connection with the coming meeting of the Northwest Mining Association: "Another thing that is being pushed by the Northwest Mining Association is the establishment of a National Department of Mining, with proper representation in the President's cabinet. Nearly five hundred letters have been written to the different universities, mining schools, geologists, mining men, etc., throughout the country on this subject, pointing out the advisability of such a department being established in the United States and endeavoring, through their co-operation, to procure the establishment of such an office."

In the thirteenth report of the State Mineralogist, filed last week at Sacramento, in his letter of transmission to the trustees, Mr. Crawford says: "It is confidently believed that the mineral industry of the whole country would be greatly improved should a department of mines be created in the United States Government. The various bureaus relating to mining are scattered through the several existing departments, and as a matter of economy, as well as the means of stimulating and encouraging more full and systematic development and research, such a department should be created."

No industry does nor has done so much for the development of this country as mining; no industry has added more directly to its wealth, and there is no industry that has received less recognition. The advantages that would accrue from the establishment of a department of mining would be far more to the benefit of other industries than even to mining itself.

Concentrates.

It is proposed to erect a 10-stamp mill in the Louisiana mine in Mariposa county.

The Faulkner mines, near Forbestown, Butte county, have been bonded by capitalists from Texas.

There are 975 voters registered in Reno—a gain of over 300 over the registration of two years ago.

H. P. Stoy of Forbestown has purchased the Golden Queen quartz mine, which adjoins the Gold Bank.

An attempt was made last week to burn the mill building on the Linderaxa mine in Calaveras county.

Three daily stages now ply between Mojave and Randsburg to accommodate the traffic to the mines.

English capitalists have bonded the Winnamuck mine in the Bingham district, Utah, for, it is understood, $100,000.

The Noble Five mine in the Kootenay country, B. C., contemplates erecting a concentrator with a capacity of 100 tons daily.

Representatives of the MacArthur-Forrest process are applying it to the extraction of the gold from the black sands of Idaho.

The Dalton and Lark like the Silver King and other mines in Utah have, owing to the fall in lead, stopped paying dividends.

Estimates of the amount of gold obtained by the miners from the Yukon placers this year vary from $100,000 to $1,000,000.

An order has been placed for sixteen additional tanks in the Mercur mill, which will increase the capacity of the plant to over 400 tons a day.

Articles have been filed for the incorporation of the Palmer Mountain Gold Mining and Tunnel Company at Spokane, with a capital stock of $5,000,000.

The last cleanup made by the Chinese company operating the Montezuma hydraulic mine at South Fork, in Siskiyou, is said to have been nearly $9000.

The Anaconda Company is taking out and shipping from its mines at Belt, Montana, to their works at Anaconda from 1500 to 2000 tons of coal and five cars of coke daily.

The California Exploration Company is pushing work on its electric plant on the river opposite Mokelumne Hill, with about 100 men grading for the plant, digging ditches, etc.

The Park City *Patriot* says that all the machinery for the Peck concentrator at Park City is made and stored away at the factory, where it will remain until after the Presidential election.

At the annual meeting of the W. Y. O. D. Mining Company at Grass Valley the following were elected directors: J. R. K. Nuttall, Joseph Weissbein, Jacob Weissbein, Louis B. Parrott, and T. H. Simonds.

A report comes from Telluride, Col., that last Sunday nine 100 pound sacks of gold ore, valued at $30,000, were stolen from the powder magazine of the Tom Boy mine, where it had been temporarily placed.

The *Mining Journal*, published at Ashcroft, B. C., says that the Cinnabar Mining Company, at Savona's Ferry, own the only quicksilver mine under the British flag, and that they have ordered machinery from San Francisco.

The Calaveras County Miners' Association was formed last week with the following officers: President, F. F. Thomas of the Gwin mine; vice-president, C. Borger of Campo Seco; secretary, Mark B. Kerr of the South Paloma.

The Victor Illuminating and Power Company has been incorporated and has asked the grant of a franchise permitting them to furnish light and power to the city of Victor, Col. The company propose to build works of the most modern type, costing about $30,000.

The Anaconda Mining Company of Montana is to have a new plant at Anaconda, to treat the silver slimes which come from the refinery, with a capacity of producing 500,000 ounces of silver per month. There will be four furnaces and two dry pans, each containing ten tanks.

At a hydraulic mine owned by E. N. Polley at Brandy City, in Sierra county, there is a sluicing flume 6200 feet long, which carries the tailings to a dump in old worked-out ground. This, however, enables him to work only the top gravel, leaving 50 feet of the best paying ground untouched.

Hardly a week passes without the discovery of one of the old fabled lost mines of the West. The "Pegleg" was found a few days ago in southern California, and now comes the discovery of the "Lost Cabin mine," in the Cœur d'Alene country. The exact location is kept secret. That is right.

The engineers will not conclude the survey of the section of the Blackfoot reservation in Montana, ceded by the Indians to the Government, until next summer. Reports from people who have been examining the lands largely discount the tales that have been told of the presence of rich mineral deposits.

The Silver City *Enterprise* says: "W. H. Newcomb has been shipping four cars of iron per day to the smelters. The strike at Leadville has shut off the supply of iron ore from that point and as the smelters must have iron for a flux, the ores of Grant county are the next nearest available supply."

The Utah Asphaltum Company have sold a carload of asphaltum for Eastern shipment, and if the quality proves satisfactory they will have a steady market for all they can mine. The deposit is on the line of the Rio Grande Western railway, apparently in the same belt as the gilsonite of the Uintah reservation.

A telegram from Redding announces that the smelters at Iron Mountain have resumed operations with increased force and capacity. The plant is working smoothly and is a complete success. About 1000 men are now employed and before the end of the month 2000 will be employed. Five hundred roasters are being built.

Bulletin No. 9 of the State Mining Bureau, "Mine Drainage, Pumps, etc.," by Hans C. Behr, is ready for distribution, and it will be found of great value to many miners in California as well as elsewhere, for there has not been any comprehensive treatise on this subject within easy reach of the majority of miners in this State. It is the publication of works like this, on special subjects, by acknowledged authorities, that will do more than anything else for the reputation of the Mining Bureau.

Last week the mining brokers of Spokane held a meeting to plan for the organization of a mining exchange in that city. They say it is needed to place the legitimate mining properties properly upon the market in order to discriminate against wild cats and in other ways to establish the prominence of Spokane as a mining center.

There has been no quicksilver mined in Australia, but reports come that discoveries of cinnabar have been made on the Clarence river, and the Cinnabar Prospecting Company claim that the existence of lodes has been proved for a length of 2250 yards in the property, and that some of them were large and had given a high percentage of metallic mercury.

Last week orders were received in this city for hydraulic giants for the gravel mines at Astorga, in the Cantabrian mountains, in the northern part of Spain. These mines were worked by the Romans, but abandoned under Spanish rule, and are now being reopened on a large scale by a syndicate of French capitalists. Joseph McGillivray, formerly of this city, is acting as their consulting engineer.

During the past six months a number of tunnel enterprises have been started in the Cripple Creek district, such as the Squaw mountain, Watson, Raven, Beacon hill, Anaconda, Moffitt & Bush and Golden Gate Tunnel & Transportation Company tunnels. These tunnels, or tunnel sites, are located and surveyed to cut at right angles the veins of the rich mountains of the Cripple Creek district. The tunnel, by law, is entitled to the discoveries and location of all lodes discovered.

The Calaveras *Chronicle* says that mines around West Point as a rule in the past couple of years have not been having very regular pay days. Mining bilks and frauds have been coming and starting miners to work here, taking out a grind of several hundred dollars, putting it in their pockets and walking out of town. Similar reports come occasionally from other parts of the State, but altogether the amount of money lost by miners in this way in California is very small in proportion to the total paid out.

At the Sunshine mine in the Mercur district, according to the Salt Lake *Tribune*, it has been ascertained by the management that in the tailings remained about 17 per cent of moisture and that in this was contained an average of about $1. In order to save this loss preparations are being made to force this moisture from the mass by the application of air under pressure. The company has also decided that more effective and more profitable results may be obtained by applying the solution from below, and this is now being done.

The Boundary Creek, B. C., *Times* says: "There can be no doubt that had trade with our southern neighbors been less restricted in the past, the mining industry of British Columbia, and it is to the mining industry almost entirely that the province must depend for its future prosperity, had, we repeat, mining men from the other side received the encouragement commensurate with the energy and enterprise they have exhibited while operating in British Columbia, the mining industry would have been advanced by many stages beyond its present condition."

The Victor Mining Company of Colorado in its annual statement shows that the gross output of the mine for the year ending August 3rd, was 13,735 tons of ore, aggregating $435,183 in value, an average of $31.76 per ton. Of this amount 3073 tons of smelting ore averaged 6.18 ounces gold and 2.96 ounces silver per ton, and 10,662 tons of milling ore averaged 95 ounces of gold per ton. Twelve monthly dividends have been paid during the year of $20,000 each, and the company at the date of the statement had $48,213 in the treasury. The expense of the company during the year was $184,880 of which $121,159 was for wages.

W. C. Bruson has filed with the County Recorder of Shasta county locations of 60,000 miner's inches of water of the McCloud river, to be used for irrigating, mining, generating mechanical and electrical power in and about the iron deposits at the junction of the Pitt and McCloud rivers. It is proposed also that the water will also be used to supply the city of Redding. Charles E. Thurston also filed locations of a water right to 20,000 inches of the waters of the Sacramento river to be taken out of the stream at Pond island, to be used for irrigation, domestic purposes, generating electric power and to supply the city of Redding with water.

While the difficulty between the British and the Matabeles seems to be about over, the British leaders seem to be falling out among themselves. Between Cecil Rhodes and General Carrington there are disputes as to policy, and Colonel Baden-Powell has been ordered under arrest by Lord Rosmead, the high commissioner, pending an inquiry, for having confirmed the execution of the Matabele chief, Makoni. It is reported that at an indaba held with General Carrington, commander-in-chief of the imperial forces, and Cecil Rhodes by the Matoppo chiefs the latter agreed to quit the Matoppo hills and settle in the open country. Mr. Rhodes promised to assist them with seed corn.

The Denver *Republican* says: "The activity in California gold mining districts this year suggests that that State will greatly increase its output of the yellow metal compared with last year. Unfortunately, the same can not be said of Colorado. It is probable the product this year will not equal that of 1895. The decreased production of certain prominent Cripple Creek mines is largely to blame for this. It is all the more mortifying to the people because these mines are believed to be as rich in ore as they were last year. They could have been made to produce heavily. It is hoped that after the election renewed attention will be given to gold mining all over the State, whether McKinley is elected or whether Bryan wins."

A metallurgist gives through the Salt Lake *Tribune* a warning that it would be well for many California mine owners to heed: He says: "The miner who allows the slimes from his mill to go to waste in the face of recent inventions for the saving of their metallic values is over looking what might be a fortune in the bulk. I have visited nearly all of the camps in which mills are operated the present season, and except at Park City I saw no one who was making a pretense of saving them. I believe it a serious mistake. The system of handling and extracting the value of gold ore has been revolutionized since the introduction of the cyanide of potassium, but that is sometimes cheated and a loss is sustained through the slimes that with facilities now afforded should be easily recovered. They are doing it in South Africa; why not in Utah?"

The Leadville strike will probably soon be at an end. Monday morning at 1 o'clock an attempt was made to blow up the works at the Coronado mine. Much damage was done, several lives were lost and a reign of terror ensued. The Governor of Colorado has ordered the troops to Leadville. The trouble was caused by a lawless element, comparatively few in numbers, who have brought on the crisis. The strike began June 20th, when at 11 o'clock at night, the men in two or three of the leading mines walked out. The union scale of wages in Leadville was $3 for everybody; but in 1893, when the price of silver dropped below 60 cents an ounce, an agreement was made that $2.50 should be accepted for some classes of work until silver should return to 83 cents. This agreement, the miners afterward declared, was unfair, as many of the mines paid large dividends. It was to enforce the original scale of $3 that the men struck. About 3000 men were involved. Within the last two weeks several mines have resumed work and last week the output was 1200 tons daily, against 2000 tons before the strike.

The Boston *Transcript* of September 11th says: "Delinquent shareholders of the Merced Gold Mining Company, who have not paid the $2 assessment due June 18th last, received notice by mail this morning that if the assessment was not paid immediately their stock would be declared forfeited and the same advertised for sale." Commenting on this, the Mariposa *Gazette* says: "The stock of the company is listed on the Boston Stock Board among the unlisted securities. This is probably the outcome of the scheme to freeze out small stockholders. After the required notice, the stock of the delinquents will no doubt be sold and bought in most probably by those most interested, and in all probability a resumption of better times will follow for a while at the company's mines in Coulterville. The general public have had their faith shaken in the integrity of the company, and rightly so. The collapse of last summer was not the result of the failure of the property to meet expectations, but was the result of sharp practice and of stock schemes. The mines to day are as good as ever they were, and, with sufficient development, will so prove themselves."

The fall meeting of the American Institute of Mining Engineers began in Denver, Colorado, last Monday. Monday and Tuesday were passed in Denver with two sessions for business and the reading of papers and discussions and the usual opening business meeting. On Wednesday the members left Denver by special train, reaching Cripple Creek in the afternoon. The rest of Wednesday and all of Thursday were passed at Cripple Creek, where two sessions were held. On Friday a visit was paid to Colorado Springs, and from that place members went to Florence. To-day, after visiting the reduction works at Florence, they will be taken to Pueblo. On Monday morning the members will pay a visit to Central City, and from that place will go to Golden. The closing business session of the meeting will be held at the State School of Mines at Golden. Many papers and discussions have been submitted by members for this meeting, including articles by Charles W. Goodale, J. D. Pennock, C. P. Dewey, W. S. Grisley, Robert Gilman Brown, William P. Blake, Marcus R. Campbell, Carl Henrich, Joseph Hartshorne, J. A. Porter, H. Van F. Furman, Irving Hale, Arthur Lakes, Rossiter W. Raymond, W. M. Brewer, Frank C. Smith, Albert Sauvear, L. D. Godshall, Henry G. Granger and L. S. Austin.

The Nelson, B. C., *Tribune* advocates that all mining corporations doing business in British Columbia be required to incorporate under the laws of the Province. It says: "A great percentage of the mining companies operating in southern Kootenay are organized under the laws of the State of Washington, and with respect to several of them there is considerable uneasiness. Especially is this the case with respect to companies organized for development purposes, without any capital whatever save such as they raise through the sale of what is commonly called treasury stock. As matters stand, all that foreign companies have to do is to add the word 'foreign' after their title, register the memorandum of association and their head office, and commence doing business. In this Province aliens have the right to acquire and hold mineral claims, which cannot be done in the United States. It would therefore be no hardship if the Government required every company engaged in mining in this Province to incorporate under the laws of the Province." The legislature of 1884 passed an act providing, among other things, that where any advertisement, letter head, postal card, account or document issued, published or circulated by any corporation, association or company, or any officer, agent or employe of such corporation, association or company, purports to state the subscribed capital of the company, then the capital actually and in good faith subscribed, and no more, shall be so stated. Severe penalties are prescribed for violation of this law.

Percy F. Marks, in the London *Financial News*, speaks of the Cripple Creek district, which he has been visiting, as follows: "Neither does this fortunate individual stand in any need of capital in order to carry on his work. He wants no mill of his own, nor any expensive tram lines or any other appliances or machinery. There are at least two big public mills erected within a few miles of most of the mine shafts, while three or four purchasing agents attend at each claim daily, soliciting business. As many railroad touts are met with, all asking for the privilege of shipping the ore from the mine to the mills waiting to crush it. Add to this the number of representatives from various parts of the world who are bidding against one another to buy the mine right out, and it will not be difficult to picture the insolent air of independence which most of the mine owners assume. It is necessary to approach them, not only 'hat in hand,' but also upon bended knees. Even if their own knowledge did not tell them that they owned 'a soft thing,' the fact is being continuously drummed into their ears by the local press, which is necessarily proclaiming the astonishing value of Cripple Creek and extolling the prospects of the whole surrounding district. According to these Solons, there never has been such a gold field, and there never will be such another in the whole world. Furthermore, every endeavor is being made to shut out British capital and enterprise. Brother Jonathan does not mind sending us superfluous rubbish and wildcats, but when he does find a good thing he keeps it. And he appears to have found in the gold fields of Cripple Creek an uncommonly good thing."

An Advance in Gravel Mining.

(Continued from page 253.)

Feather the elevators are working in the river bed with most satisfactory results.

The service of the water in these cases, it will be observed, is large. The Risdon Iron and Locomotive Works of San Francisco are the manufacturers. In order to determine the size of machines and amount that may be handled, the following data must be given:

1. Quantity of water available for elevating purposes.
2. Hydrostatic head of water.
3. Distance to which material is to be elevated.
4. Largest size of gravel to be handled.

Gold Deposits in Nicaragua.

United States Consul Thomas O'Hara sends to the State Department some data on the gold deposits in Nicaragua, in which he says that along the Prinzapulca and some of its upper affluents rich placers have been found, several very small pockets having yielded from $3,000 to $20,000 each. The annual shipments of gold dust from the Prinzapulca region are generally estimated to have averaged $150,000 since 1888. At least two-thirds of the gold gathered in the district finds its way to Bluefields.

Many parts of northeastern Nicaragua remain unexplored. The greater part of the country is densely wooded and travel in most places is necessarily confined to the rivers. Many of the rivers are shallow and are filled with rapids.

An exploring expedition bound for the headwaters of either the Prinzapulca or Rio Grande, and gotten up to make an earnest and a systematic search for gold, should be supplied with sufficient flour, rice, beans, bacon, canned meats, lard and coffee to last from four to six months. The expedition should be properly manned, as there are many places at which the canoes and supplies must be dragged or carried long distances. Under the most favorable conditions as to season and weather explorers in northeastern Nicaragua must expect to experience uncommon exposures, fatigue and other hardships. It is a section in which inexperienced gold seekers are apt to become disheartened, and one in which veterans will find that health and hardihood do not make up for scarcity of store provisions.

Auriferous ores have been discovered near the heads of the Pis Pis, Banbana and Tunky rivers.

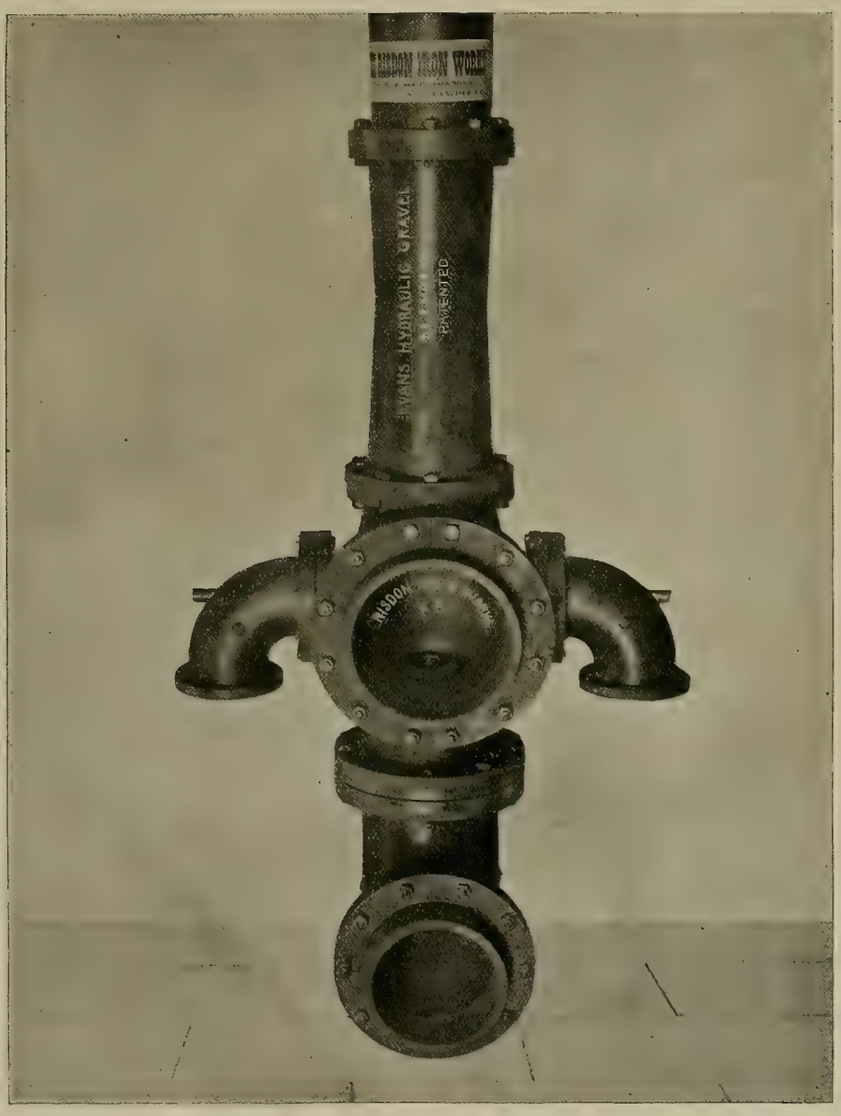
An article published in *Diario de Nicaragua* is quoted, in which it is said that Nicaragua possesses rich mines of gold, silver, copper, iron, zinc, opal, coal, gypsum, marble, white and brown limestone, alabaster, slate, alum, sulphur, saltpeter, etc. Besides the great but improperly developed mineral wealth of the mountainous regions, many parts of which, unfortunately, have not been explored, there is an abundance of auriferous ores in the districts of Nueva Segovia and Chontales. The greater part of the gold which is exported from Nicaragua is produced in these districts. The gold mines worked with the most proficiency are in the mining district of La Libertad, in Chontales, but even there much of the machinery used is of antiquated type. The ore in this district runs from 5 pennyweights to 2 ounces gold per ton, the gold being from 15 to 20 carats fine.

Mr. O'Hara tells of the formation of a company organized lately in Chicago with a capital of $1,000,000 to work mines on the Pis Pis river, where a 20-stamp mill has been erected. In conclusion, he says: "I do not advise people to either purchase mining stocks or rush to Nicaragua in search of gold, but I believe that a live agent might be able to sell considerable mining machinery and supplies in the country."

Improved Processes for Reducing and Saving Precious Metals.

By ALFRED VON DER ROPP, Superintendent of Selby Smelting and Lead Company.

It often happens to us who are engaged in helping to produce the precious metals, that men pursuing other vocations ask the question why there is such a marked difference in the cost of producing the precious metals now as compared with earlier methods; why mines that years ago were abandoned are worked once more and begin to pay dividends, and often handsome ones, where before they proved a source of losses. The natural answer is, mining in all its different branches is less expensive to-day than it used to be, and the skill of the mining men, as well as of the metallurgist, has kept pace with the times and this to such a degree that American, and especially California, mining engineers and metallurgists are to-day engaged at large salaries to go to foreign lands to develop mines, erect and operate reduction works of all kinds and introduce new and effective machinery.



EVANS HYDRAULIC GRAVEL ELEVATOR.

To quote just a few instances where American skill has taken the lead in foreign countries, let me recall that the largest lead-silver producer in the world to-day—the Broken Hill Proprietary Co. of New South Wales, Australia,—was mainly developed by Nevada and Colorado talent. The Mount Lyall Co. of Tasmania is practically under the management of American engineers. The diamond mines in South Africa have a Californian as manager, and the Transvaal gold fields were and are now in the hands of men whose names are known to all of us on this coast—in fact, so many able engineers have made the Transvaal their homes in the last few years that it looked for a while as if we would be short of talent to develop our own resources. Only recently another California engineer has been engaged at a princely salary to examine into the mineral wealth of Siberia, which country no doubt will soon call on us to furnish more talent and plenty of machinery.

As to the means of reducing the precious metals from the ores mined in our Western States, and particularly in California, there has been such a change that thousands of tons that were allowed to go to waste in the earlier days are now considered well worth saving. I refer especially to the sulphurets in the ores. It is well known, of course, that many of the ores produced here in California—and I speak now of gold ores—contain more or less of the sulphides of the base metals, which in their turn often contain gold which will not amalgamate directly. In other words, the gold in these ores is only partly free milling. In earlier days these sulphides were allowed to remain in the tailings and run to waste. The new concentrating machinery of to-day saves these sulphurets and turns them over to special processes whose duty it is to extract the gold from this refractory material and thus often enables a mine to pay handsome dividends, which, under the old regime, would have been operated at a dead loss.

The processes by which the gold is extracted from these sulphurets may be classified as follows:

I. The wet processes.
II. The fire process.

The wet processes are:

1. Chlorination,
2. Bromination,
3. The Cyanide Process.

All of these give good results if properly applied, but I shall confine myself to the fire process with which, I think, the public is less familiar. The fire process of extracting the gold from the concentrates or sulphurets is based on the following simple reactions:

The gold will be absorbed by metallic lead or copper sulphide, ordinarily called matte, if both the gold-carrying material as well as one of these two media named are brought in contact in a molten state; or, to use a chemical term, the affinity of the gold in the ores or concentrates is more intense for metallic lead or copper matte than for the metals with which nature had associated it.

In smelting the raw material with one of the two above-named media, we have, generally speaking, two products, namely, slag and lead bullion, which latter has absorbed the gold or silver from the ores, or slag and a copper matte which has combined with the gold.

Which of these two processes is to be used depends on local conditions and is largely a business question. The process of allowing the gold in the raw material to accumulate in metallic lead is the one more generally used, while the separation of the gold from the ores by means of a copper matte has only recently been introduced on this coast.

This latter process is the one that has enabled the miner to sell his base or refractory ores and his concentrates to better advantage than was the case only about a year ago, and this process, I dare say, will consequently be of more interest to the miner than the older reduction methods. To describe this process, in which copper matte plays the roll of accumulator or separator of gold from base ore or concentrates, as the case might be, it will be necessary to describe roughly the character of the raw material to be treated.

The ores are, as a rule, composed of silica or quartz, with more or less of the sulphides of iron, copper and sometimes zinc. The sulphurets are of the same composition qualitatively, while they differ from the ores in their quantitative makeup. In other words, the sulphurets, being a product of the concentrating mills, will contain more of the heavy or base sulphides than the original ore did. As it is essential in the fire process that the material to be smelted should contain its own flux, this quality of the sulphurets, namely, that they contain iron in large quantities, makes them especially desirable to the smelting works. But, on the other hand, the sulphurets contain large quantities of sulphur which have to be eliminated to some extent before the smelting process proper can begin, because the iron is only available as a flux when in an oxidized state. To transform the sulphide of iron into an oxide the raw material has to undergo the so-called roasting process, in which the largest part of the sulphur is oxidized or burned off, leaving the iron as an oxide.

In this roasting process, especially, we find im-

provements that have very much transformed and enlarged the old style smelting works. We used to roast the ores in the so-called hand reverberatory furnaces, where the ore was stirred and moved ahead by men—a hard and unsatisfactory method of roasting, running the cost of treatment up to forbidding figures. To-day there are many types of furnaces that do all this work by steam. The ore is fed into the roaster by machinery. Machinery accomplishes the stirring and moving of the ore, and the finished product is discharged by the same machinery into cars, ready to be dumped into smelting furnace proper. Not alone has the cost of roasting been reduced to about one-eighth of what it used to cost in the old hand reverberatories, but the end product is more uniform, as it does not require skilled labor when steam does the work, and we all know that steam is a pretty reliable partner as long as the fireman is not asleep. Besides, the first cost of erecting a modern roasting plant for a given tonnage is far less than it used to be before mechanical furnaces were in use.

We have now our concentrates, after passing through the roasting furnace, in proper shape to deliver them to the smelting furnace, where the separation or better accumulation of the gold and silver in a copper matte is to take place. The furnace in which the roasted concentrates are to be smelted is usually of the reverberatory type, or, to describe the same in a few words, the furnace consists of the hearth, the walls and the arch or roof.

The hearth consists of an inverted arch, built up of nine-inch firebrick; the walls are usually of firebrick, as is also the roof or arch. This latter is so constructed that the heat striking it will be thrown back or reverberated on the charge. An innovation has been made at the Selby Smelting Works in replacing the firebrick of the walls, to a certain height above the hearth, by lumps of chrome iron. This is a very refractory material and was used in Russia and France to line the furnaces for the basic steel process, in which it was found to be of better service than any firebrick on the market. The writer tried this chrome-iron lining in the copper matting furnace at Selby, and will stick to it as long as there is chrome iron in sight, as the life of the furnace is more than doubled by it.

The ore from the roasting furnaces is dumped hot into hoppers above the smelting furnace, and when a charge is needed the slides are opened and the ore is dropped on the hearth of the reverberatory furnace, where it begins to melt down in a short time.

As soon as all of the charge on the hearth is melted, the slag is allowed to run out of the furnace and to fill a row of sand moulds, each holding from 1000 to 2000 pounds of slag. After cooling, this slag is lifted from its sand bed by a grapple iron attached to a crane and loaded on cars, from which it is dumped on the waste pile. The matte, being of a heavier specific gravity than the slag, collects naturally at the deepest place of the hearth, from where it is tapped through a special opening into iron moulds. As soon as this is done a new charge is dropped into the furnace and the process of smelting goes on again.

The matte formed contains now the gold and silver originally in the ores and is mainly composed of copper and iron sulphides. This product has to undergo another process to liberate the precious metals, and there are two ways to accomplish it:

I. By the electric refining of the copper, leaving the silver and gold as a residue to be refined by themselves, or

II. By turning the matte over to the lead blast furnaces, where the iron of the matte acts as a flux and the lead combines with the gold and silver. The product thus obtained is called base bullion, being composed of lead, silver and gold, and has to undergo the process of separation and refining, of which I shall not speak here in detail.

Here in California, and especially at the Selby Smelting Works, another agent comes into play to allow low-grade refractory ores to be smelted successfully, namely, the fuel used in both the roasting as well as the smelting furnace. Since about six months ago we have been using crude oil from Ventura in both furnaces and the results are very satisfactory ones, in a technical sense, as it is essential to maintain, if possible, an oxidizing atmosphere in both the roasting and the smelting furnace. This oxidizing atmosphere can be steadily maintained by the use of oil or gas, but not so when using coal as fuel.

I have tried to keep the technical expressions out of this paper as much as possible, and hope I have been able to show at least some of the new ways and means by which gold mining in the present is made profitable, where it used to be a losing proposition; and, no doubt, every year will see new methods and new machinery come to the front to help us produce and reduce as fine metals the silver and gold of the more refractory and low-grade ores, at a cost acceptable to the miner as well as to the metallurgist.

It is proposed to sink a shaft at the Paris Exposition of 1900 to a depth of one mile. The Red Jacket shaft at Calumet, Michigan, is already down 4900 feet, and on the Rand in South Africa a number of shafts will doubtless reach over a mile by 1900.

Gold Mining in California.

By ARC. J. BOWIE, Mining Engineer.

Our gold mines have added $1,265,217,764* to the wealth of the world, and it was principally owing to their yield that the Government was able, at the time of the civil war, to maintain its credit and, later on, to resume specie payment.

The gold fields of California attracted the attention of the world, and to their production was due the prosperity of the people of this State.

The valleys of California, at one time considered hopelessly barren, were at first cultivated to supply home consumption, and, owing to the flourishing condition of the mining regions, everything produced brought a high price.

With development, the fertile nature of the soil was discovered, and there followed an era of agricultural prosperity which attained its height towards the end of the '70s, and declined as Chili, Argentine Confederation, Russia and India began to compete with us in the production of cereals.

Meantime great land speculations were entered into by shrewd individuals, who concealed their identity under the guise of corporations and did their work through lawyers and politicians, with the result that, to benefit themselves, they succeeded in persuading the then predominant farming element to involve itself in litigation with the miners.

Some idea of the extent of their speculations can be gleaned from the fact that, between 1880 and 1890, the valuation of farming lands increased, with absolutely no reason, over $435,000,000, or 160 per cent. During the interval the increase of population was insignificant, the grain business decreasing in value, and, owing to litigation, the products from the gold fields annually diminishing.

Hydraulic Mining.—It is estimated that in the hydraulic interest alone over $100,000,000 therein invested were affected by the decision of the United States Circuit Court of this State. Strange though it may appear, it was discovered that the hydraulic miner had no legal status in court. In a country made by him he was simply an outlaw, and it was only to the action of the Legislature of 1892 that sections 1424 and 1425 were added to the code, placing hydraulic mining among the legitimate industries of the State. Miners from California, driven out by the closing of mining operations, directly and indirectly affecting all interests, are found to-day in all parts of the world, whereas our mineral resources, if we were permitted to develop them, would give them ample occupation at home, and afford employment for millions of capital. However, before this condition can exist, there must be perfect security for investment, and, without it, there can never be perfect prosperity; or, in the words of Macaulay, "public prosperity could only be restored by the restoration of private prosperity, and private prosperity could be restored only by years of peace and security."

Legitimate and Speculative Mining.—In dealing with mines a distinction must be made between legitimate and speculative mining. By legitimate mining is understood the purchase of properties developed, with ore in sight and estimated to give a stated net monthly output from the working of a definite number of tons per diem, with a stated yield per ton at a given cost, the price paid for the property being determined by the value of the ore in sight, calculated to return a given monthly percentage on a specified capital. Few of the prominent dividend-paying gold mines of California in former days were listed on the Stock Exchange. The owners quietly worked them and were satisfied with their production. This is especially true of the most prominent mines, such as the old Hayward mine in Amador county, near Sutter Creek; the Keystone mine, near Amador City; the celebrated Sierra Buttes mine in Sierra county; the Plumas-Eureka; the Eureka mine at Grass Valley; the Idaho and Maryland mines of Grass Valley; the Black Bear of Siskiyou, and numerous others which could be mentioned. During the latter days of the working of several of these mines the stock of some of the companies was listed and a speculative value was given to it over and above what was considered legitimate by the interest then paid on the investment. The stock operator was, as a rule, but little tempted by such securities, and the daily variations were not sufficiently large, and the quantity of stock offering too limited, to permit of any large amount of money being made in daily transactions, particularly during the palmy days of mining excitement in Pioche and on the Comstock, when fortunes were sometimes made in a very few days, and, as may be truly added, were lost with even greater rapidity.

Speculative Mines.—What is understood by mining speculation in gold quartz properties is the purchase from prospectors or owners of what they state to be the location of a valuable ledge or deposit, necessarily containing gold, whether in paying quantities or not. It is supposed that such ledges or deposits exist and it is hoped that no one with experience would take up such an enterprise without positive knowledge of their existence. The precaution of making investigation to this end is very essential, as could be proven by capitalists to whom so-called mining claims have been offered, which were subsequently found to exist only on paper. These cases are naturally exceptional, but when competent men report the exact facts and the indications warrant an investigation, the full status of affairs being known, the speculation becomes legitimate and the extent to which any man invests must be at his own risk and regulated by his own judgment.

Mining as a Business Proposition.—Mining reduced to a business proposition and given due attention, involves no greater risks than any other legitimate business. The life of a mine is limited, but the purchaser protects himself by the developments of the enterprise and the rate of interest on the capital invested demanded from it, and, at the same time, following the progress of the prospecting. The additional speculative value given to a property by the progress of the different developments in the lower levels, is simply an anticipation of what is expected will be developed. The speculation is a matter of judgment, not only as regards the development itself, but as regards the public pulse and the ability of the operator to stand the financial consequences. Similar transactions in real estate take place every day in all the markets of the world.

An Outline of the Topography and Geology of California.—The topographical features of central California are exceedingly simple. Four equi-distant parallel lines can be used in conveying a general idea of the physical geography of the State.

A main axial line whose course would be N. 31 W., passing through the culminating peaks of the Sierra Nevada for a distance of nearly 500 miles, can be assumed as the eastern boundary of the gold region.

A second parallel drawn fifty miles west of the main axial line will skirt the west base of the Sierra Nevada along the foothills from Red Bluff to Visalia.

A third parallel line equi-distant from the second will follow very closely the eastern edge of the Coast Range from the neighborhood of Clear lake to that of Kern lake, a distance of over 300 miles.

A fourth equi-distant parallel will represent as nearly as possible the coast line of the Pacific, the western base of the coast ranges.

These parallels divide the central portion of the State between Red Bluff (about latitude 40° north) and Fort Tejon (about latitude 35° north) into three belts, namely, the Sierra, the great valley of California, and the coast ranges.

This arrangement of physical features holds good for a length of about 400 miles in the direction of the main axial line.

This division of California is the largest and by far the most important, embracing the whole of the agricultural and most of the mining districts.

These lines divide the State geologically as well as physically.

The great valley is the belt of recent alluvial deposits; the Sierra is the belt of intrusive granite, of strata of Triassic and Jurassic age, with important Pliocene river deposits of ante-Cretaceous elevation and of the metamorphism induced by heat and pressure and resulting in a hard and crystalline condition of the rocks; the coast ranges from the strata chiefly of Cretaceous and Tertiary age, of post-Cretaceous elevation and of chemical metamorphism.

The Sierra is the belt of the precious metals, with some iron and copper; the coast ranges are principally of quicksilver and carbonaceous material. The Sierra is the region of lofty heights, the coast ranges of moderate elevation, and the great valley of nearly dead level.

In the Sierra volcanic activity has nearly ceased, but in the coast ranges solfataric action is still apparent.

The Topographical Structure.—The Sierra Nevada is a well-defined range of mountains, situated on the ledge of a high plateau, its eastern base being about 4000 feet high, while its western side (broken by steep canyons) slopes nearly to the sea level.

The general elevation of the range in the northern part of the State may be assumed to be 7000 or 8000 feet. Mt. Shasta, the highest point of this section, rises to a height of 14,440 feet, dominating all the others. South from Lassen's peak to near Tejon Pass, the Sierra Nevada forms a clearly defined crest, gradually increasing toward the south.

Along the headwaters of the Feather river the elevation of the prominent peaks is about 9000 feet and the passes 5000 to 6000 feet. Lassen's Peak rises 10,500 feet above the sea level.

Around the headwaters of the American river the main crest is a little over 9000 feet high and the passes 7000 to 8900 feet.

At the headwaters of the Merced and Tuolumne the main peaks are 12,000 to 13,000 feet high and the passes 9000 to 10,000 feet.

In the region of the headwaters of the Kern, Kings and San Joaquin rivers the main crest is 12,000 to 13,000 feet, with numerous points exceeding 14,000 feet high, Mt. Whitney being the culminating peak.

General Geological Structure.—The Sierra Nevada is made up of (1st) a central intrusive core of granite,

*Corrected and U. S. Mint Rep. ending Dec. 31, '95.

flanked by (2nd) metamorphic slates of Triassic and Jurassic age (the so-called auriferous slate formation) over which lies (3rd) a covering of Cretaceous Tertiary and post-Tertiary deposits, which are either (*a*) the river deposits which form the material which is washed, either by hydraulic or drift process, or to extract the gold contained therein; or, (*b*) sedementary volcanic layers; or, (*c*) lava; or, finally, in some places, (*d*) marine formations.

Granite.—The granite occurs in the extreme northwestern part of the State, disappearing in the northeastern under the extensive lava beds, reappearing in Butte and Plumas counties, and continuing to increase in amount of exposure toward the south, until, in Fresno and Tulare counties, it forms territorially by far the greater part of the belt, extending from the crest almost down to the plain.

Auriferous Slate Formation.—The auriferous slate formation, consisting chiefly of metamorphic, crystaline argillaceous, chloritic and talcose slate, appears with, but subordinate to, the granite in the northwest. It appears again in Plumas and Butte counties, increases in importance as the overlying lava decreases. North of the American river it occupies nearly the whole width of the western slope of the Sierra, with occasional areas of granite enclosed in it. Going south, it gradually contracts in width, being of but little importance south of Mariposa county. In the extreme south of the junction of the Sierra and the Coast ranges it reappears and continues in San Bernardino and San Diego counties in connection with the granite. The strata of this formation is elevated very considerably, often in a nearly vertical position. Speaking in very general terms, it may be said that the strike of the slates is usually parallel with the axis of the range, and the dip of the southern portion of the belt is generally to the east.

Gold Quartz Veins.—In this formation occur almost exclusively the veins of quartz which carry gold in amounts which pay for working. While such veins occur also in the granite and likewise, as has been mentioned, in some of the Coast Range formations, the paying gold quartz is rarely found outside of the auriferous slate formation. Some of these veins are of very great size, notably the great quartz vein which has been traced from the center of Amador county through Calaveras and Tuolumne into Mariposa to the Mariposa estate, a distance of 80 miles. The vein obtains a width in places of several hundred feet.

The mother lode is an auriferous belt whose strike is N.W. and S.E. The "lode" dips eastward at an angle of from 45° to 70° to the horizon. The hanging wall is greenstone and the foot wall is slate.

Professor Whitney, in speaking of it, says: "It is not by any means a continuous bed, or vein, of quartz, but, rather, a series of nearly parallel belts of lenticular masses with barren intervals between them, but yet arranged nearly on the same course."

The geological maps of California note the location of gold deposits from the Colorado river on the south to the dividing line of Oregon on the north, a distance approximating 800 miles. This great length of territory, extending along the western slope of the Sierra Nevada, is covered with vast auriferous deposits and dotted with numerous quartz veins from one end of the State to the other. St. Julian district in San Diego county, on the edge of the desert, has given us two mines—the Golden Chariot and the Stonewall Jackson—which have produced several thousand tons of some of the highest average-grade gold quartz found in the State. Sierra, Plumas, Nevada, Amador, Sutter, Mariposa, Tuolumne, Calaveras, Shasta, Siskiyou and Trinity counties have made the State famous by their yield of placer and quartz deposits.

Depth in California Gold Mines.—The greatest depth attained by a gold mine in California is 2400 feet.* The Hayward mine, in Amador county, when closed down after the fire, had reached a vertical depth approximating 1900 feet in the Eureka shaft, at which point the ledge was said to have been fully as strong and rich as it was on the 800 level, down to the 1300, where it averaged from $14 to $20 per ton in the mill. In its early history the rock from the surface of the 600-foot level is said to have varied from $6 to $8 per ton and did not pay the cost of extraction. The Kennedy mine, in Amador county, was worked for years and years, hardly making both ends meet, until the 1300 level was cut, and from that time on to the present date the mine has steadily paid dividends, and has reached a depth of 2100 feet,† or 400 feet below sea level, at which point a level is now being opened, and a crossdrift will be driven to meet the bonanza now being worked on the upper level. Eastern and European capital is at present being expended in sinking a shaft at the Oneida mine, which is situated between the Kennedy on the south and the Hayward mine on the north, the intention being to cut the vein on the 1800 level below the collar of the shaft, then unwater the old mine and develop it in depth. The developments in Nevada county have all tended to show the continuity of the principal quartz veins in depth, and, likewise, the continuation of pay ore. The same may be said of the mines in Tuolumne county, where the Rawhide mine is now working on the 1000-foot level, and in mines in different places throughout the State.

Gold Quartz Deposits.—It may be proper to explain how these gold deposits, or gold quartz veins, occur. As a general proposition, the gold quartz bodies of California are found in veins. A vein simply means a fissure; in other words, it is a crack in the earth's surface, into which the quartz or other material has been injected or deposited by natural causes. Veins are divided into four classes: true veins, contact, bedded and lenticular veins. These segregations simply indicate their mode of occurrence. A true vein is supposed to be a fissure of deep-seated origin, which traverses a rock or formation independent of its texture and position, not parallel to its stratification or foliation. A contact vein occurs between two different formations. A bedded vein is a deposit which occurs between the lamina or layers of a formation necessarily parallel with it, like a coal bed, for which it could be mistaken were it not for its fissure nature. Lenticular veins thin out in all directions, are in part only local expansions of really continuous fissures, in part, on the contrary, lentiform secretions, and are not then properly veins. There are numerous other subdivisions of ore deposits, which it is here unnecessary to mention.

The Strike.—Every vein runs in some general direction. This general direction or course in a horizontal direction is known as the strike, and the inclination or angle which the vein takes from a horizontal plane on the surface of the ground is called its dip. The quartz or material bearing the gold fills the fissures, but it must not be supposed for an instant that the fissures are of even width in length or depth. Irregularities in the contraction of the fissure are liable to occur from natural agencies which produce contractions, twists and bends, caused by lateral and end pressure under a superincumbent weight and assisted at times by slips of either the foot or hanging wall, or of both, or of cross fissures or dikes intruding, which may produce throws.

It is therefore evident that a miner when once underground is liable to encounter a great many obstacles which cannot be foreseen. It is an accepted fact by those who have studied the question of mineral deposits, that the walls of a vein, the peculiar location of the deposit in the fissure, and the presence of cross veins, have more or less influence in the enrichment or impoverishment of the deposit itself.

It has already been stated that the fissures are irregular, and it may likewise be added that the gold-bearing material which fills the fissure is irregular in its thickness as well as in its contents. The pay bodies themselves take definite positions and follow a given pitch in the vein on the strike. The entire filling of a fissure is not necessarily ore, the pay ore occurring in independent bodies in the vein which are called ore chutes. The inclination which these bodies assume is called the pitch of the chute. Hence, it is not unusual to see a chute of ore pass from one claim into another, leaving the mine where it was originally encountered—that is to say, passing beyond its end line. This has been illustrated in a remarkably clear manner in the case of the Eureka mine of Grass Valley, where the pay chute passed successively into the Idaho and Maryland mines. The same chute is being worked to-day in the Maryland at a depth of 2000 feet.

Ore Chutes.—There is no limit to the length or number of chutes which may exist in a vein in any mine. There may be chutes from 50 to 100 or 1000 feet or more in length and in a location of 1500 feet. Generally, several chutes are encountered, the intervening spaces being filled with selvage or vein matter. The miner, however, in working, should note with care all the peculiarities of the deposit so as to enable him to follow up intelligently its exploration at lower levels. As long as the precious metal continues to exist in the deposit, so long must a miner have hope. According to the old adage, no hope, no miner. But, when the ore gives out, there is no known law which can tell when or where to find it.

Mine Development.—Having now described the general appearance of quartz deposits, it seems almost unnecessary to discuss the opening or development of a mine with California readers. In brief it may be stated that according to the location, a mine has to be opened by either tunnels or shafts as the case may demand, levels run at stated intervals of 100 feet to 120 feet, winzes sunk as required and the ground opened up for the extraction of ore. The size of the works depends on the development, that is to say, upon the value and productive capacity of the deposits. But one word should be added.

Let all developments be made on the vein. Any work done outside of it is so much money thrown away. Follow the vein wherever it goes and study its nature. Of course, there are instances and circumstances where vertical shafts are advisable, but never in undeveloped properties or in newly discovered districts. We have now in a cursory way looked over the question of quartz deposits.

(*To be Continued.*)

*On dip of the vein. †Vertical.

The Cyanide Process at the Utica Mine.

By THOMAS N. SMITH, Superintendent of the Chlorination Works.

The cyanide process as used at the Utica Mining Company's plant at Angels Camp is limited in its application to the smallest product from the mills, viz., the slimes saved at the canvas plant. The treatment of these is satisfactory, for we get 85% of the gold assay value at a cost of $3.50 per ton of 2000 pounds of ore treated. The plant consists of:

One agitator or pan.
One filter press for ore.
One vacuum pump.
One solution pump.
Two storage tanks, for solution.
Two zinc filters.
One tank or sump for solution.
One filter press for bullion.

A description of these will be found in Bulletin No. 5 of the State Mining Bureau.

We work as follows: The solution made up of 1600 pounds of water, in which 10 pounds of pure cyanide have been dissolved, is run into the agitator and the paddles started. The ore, weighing 4000 pounds, is then added and stirred for six hours, when the extraction is complete. It is then run into the filter press, where the solution is suched out of the ore by means of the vacuum pump. By repeated washings all of the gold and silver in solution is taken out.

This part of the process is hastened by turning the ore over to a depth of 2 inches and prodding it constantly for two hours with a square-pointed shovel after the solution is sucked below the surface. The solution used for washing is taken from the sump and is not more than enough to cover the ore 1 inch in the filter press. The solution is then run into the storage tanks. From these it passes in a small stream into the zinc boxes, upward through the zinc shavings and into the sump, freed of its gold and silver. When the time arrives for cleaning up we take the zinc shavings, together with the precipitated gold and silver, and separate the precipitate from the zinc shavings by washing with water. The shavings are put back into the boxes. The gold and silver precipitate is treated with dilute sulphuric acid, washed with water, thoroughly dried, and finally melted with borax. Our last bar was .983 fine—.783 gold, .196 silver. The plant was started July 23rd, 1893. Since then it has treated:

NAME OF ORE.	Dry Tons.	Value Per Ton.	Total Value.	Amount Realized.
Utica Canvas Plant..	$665\frac{1369}{2000}$	$44.74	$29,782.72	$25,315.31, or 85%
C. G. Betts.....	$67\frac{1397}{2000}$	41.82	2,831.15	2,406.47, or 85%
Con. Eureka	$116\frac{1347}{2000}$	36.16	4,218.91	2,025.07, or 48%
Utica Concentrates..	$8\frac{1250}{2000}$	70.14	254.26	122.04, or 48%

From the above statement it will be seen that the process shows good results with certain ores, as the fine slimes from the canvas plant at the Utica mine, from which 85% of the gold is extracted. This material is especially fitted for cyanide treatment, being composed of 80% carbonate of lime and 20% pure iron sulphurets, all of which will pass through a No. 150 mesh sieve without grinding.

With certain ores with which we have experimented the sulphurets from the Black Oak mine, Tuolumne county, for example, in which the silver predominates, an extraction of 90% of the gold and 90% of the silver can be obtained at a cost of $3.50 per ton.

With an ore from Nevada, which contained 2 ounces of gold and 170 ounces of silver, we treated 5460 pounds and extracted with cyanide 90% of the gold and 50% of the silver. We then roasted the ore and extracted 90% of the silver remaining by leaching with hyposulphite of soda. The cost of treatment was $10 per ton. By this it will be seen that cyanide has advantages as an aid to chlorination. This ore was the finest ore we have ever treated, and the most of the value was in the powder in the ore. On account of this fine powder it would have been difficult to treat by any other process and in any other way.

By reference to the statement of ores treated it will be noticed that the Con. Eureka coarse concentrates and the Utica coarse concentrates (two tons of the Utica concentrates were roasted) were not treated successfully, an extraction of 48% only being obtained. Such a poor extraction was attributed to two causes: First, to the coarseness of the sulphurets; second, to the sulphurets coming in contact with quicksilver in the batteries. If the sulphurets were saved and treated with cyanide before quicksilver was added a much better per cent would be obtained. The most favorable results can be expected from the treatment of sulphurets with cyanide when the sulphurets are very fine and the gold is fine and free.

To be able to tell whether sulphurets can be treated successfully by cyanide or not, they must first be subjected to practical tests, either with a small quantity or a large one. If these are satisfactory, and the ore remains the same, one can always be sure of getting the same results. There is no difficulty in getting the gold after it is once in solu-

tion; for zinc shavings act perfectly when used in sufficient quantity.

Cyanide has but one disadvantage. It does not, as a rule, dissolve enough of the gold and silver in an ore to make it preferable to chlorination.

A comparison of results, after experimenting with sulphurets, will show whether cyanide or chlorination is wanted.

Scientific Progress.

The Utility of Inventions.

It is no doubt true that when a new invention is introduced which revolutionizes some particular art or branch of business it at first decreases the number of persons employed in that particular line; but that is only temporary, for in a short time the result is a cheapening of the product, a greatly increased demand for it, because of this cheapening, and then necessarily an increased demand for laborers in that line, and almost universally at increased wages. The statistics show this to be true beyond the possibility of a question. The records of the Labor Bureau of the United States show that, from 1860 to 1880, the most prolific period of inventions, and the most intensified in all directions of their introduction, the population increased 59.51 per cent, while in the same period the number of persons employed in all occupations—manufacturing, agriculture, domestic service and everything—increased 109.87 per cent; and in the decade from 1870 to 1880 the population increased 30.08 per cent, while the number of persons employed increased 30 per cent. As shown by the investigation of a committee of the United States Senate, wages have increased 61 per cent in the United States since 1860. And, as we all know, during that same period the cost to the people of nearly all manufactured articles has been decreased in as great, if not a greater, ratio.—Canadian Journal of Fabrics.

By the use of the electric furnace, M. Moissan has been able to prepare the metals whose oxides have been looked upon as irreducible by carbon, says London *Engineering*. He obtained uranium in this way three years ago, and in a recent number of the *Comptes Rendus* he gives a complete account of its preparation and its properties. It is isolated in three ways: by the action of sodium at a red heat upon the double chloride of sodium and uranium, by electrolysis of this double salt in the fused state, and from the oxide by reduction with carbon in the electric furnace. The last process gives the best yields if the heating in contact with carbon is not unduly prolonged and if air is excluded. Metallic uranium, when pure, is perfectly white, and is not magnetic if free from iron. It is not hard enough to scratch glass, takes a good polish, and can be filed with ease. It is much more volatile than iron in the electric forge. M. Henri Becquerel, in the same number of the *Comptes Rendus*, tells of a remarkable and probably unique property of this metal—that of emitting invisible phosphorescent rays capable of producing photographic effects after traversing opaque bodies such as cardboard, aluminum, copper and platinum, and also able to discharge a gold-leaf electroscope. The effects produced are precisely similar to those obtained from uranium salt, except that they are nearly four times as intense.

That the manufacture of hard steels may be attended with a bi-product in the shape of diamonds, is a consideration which has not yet been reduced to any practical element, and one that may cause some surprise. Several years ago M. Moissan proved that when iron was saturated with carbon at a temperature of 3000 C., and afterwards cooled under heavy pressure, a portion of the carbon separated out in the form of minute crystals, which were found to be true diamonds. In the *Comptes Rendus* it is stated that it occurred to M. Rossel that the conditions under which very hard steels are now made should result in the formation of diamonds. He examined a large number of the steels now made, and found that his theory was supplemented by fact. The diamonds are obtained by dissolving the metal and then submitting the residue to the influence of concentrated nitric acid, fused potassium chlorate, hydrofluoric and sulphuric acids respectively. The diamonds obtained are almost microscopic in their dimensions, it is true, but they present all the physical and chemical properties which distinguish the true gem.—American Manufacturer.

At the late meeting of the American Association for the Advancement of Sciences at Buffalo, N. Y., over which Prof. Joseph Le Conte of the University of California presided, two papers on the geology of California were read by Prof. J. P. Smith of Leland Stanford University. He proved the close parallelism with the beds of Europe by the terraces of the Triassic and Jurassic eras. He described the physiography of the region, and discussed the origin and growth of the mountain ranges, illustrating his remarks by aid of the stereopticon. The main orographic movements were in the Cretaceous and Tertiary periods. He explained the Tertiary and Post-tertiary erosion and the uplifts of the Coast Range and the Sierra Nevada. He said that the great valley of California was never an arm of the sea, being full of river deposits. He traced out the ancient river systems, and spoke of recent geologic changes.

Among the many objects discovered lately by W. Flinders Petrie and others, while excavating some 30 miles from Thebes, and now on view at University College, London, there is a pair of scales, which, with the exception that they turn on a pin, exactly resemble those used in our pharmacies of to-day. The length of the beam is about 4½ inches, a ring at each end carries the original cords, which are three in number, and the pans, about the size of a penny piece, are slightly convex in shape; a small ring is attached to the top, by which they may be held; the finish and workmanship are alike excellent.

There will be held in New York, at Madison Square Gardens, in January, a gas exposition for the purpose of bringing together a collection of gas apparatus and appliances of every description, for the two-fold purpose of affording the general public and the gas engineer an opportunity to study the developments that have taken place in the gas industry during recent years. The cooking demonstrations will be a feature of the exhibition.

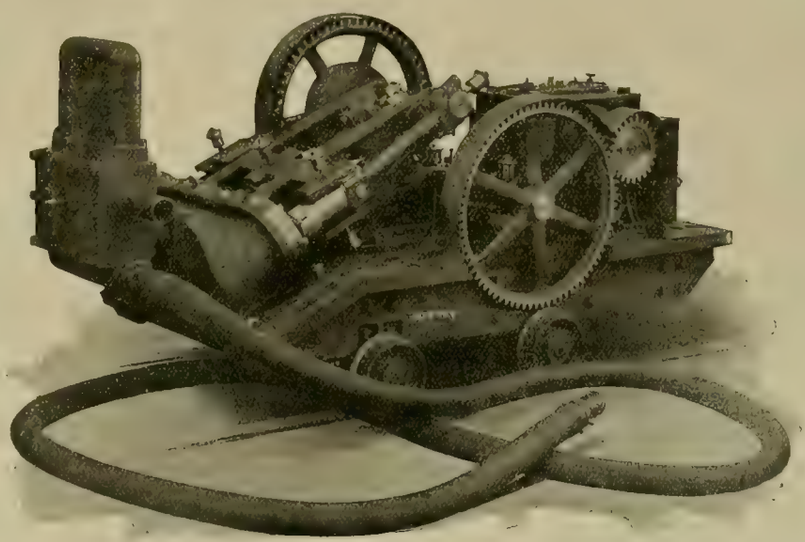
Aconcagua, the highest peak on the Western Hemisphere, is to be attempted again this fall by E. A. Fitzgerald, who explored the New Zealand Alps. If he succeeds in getting to the top, which is 23,200 feet above sea level, he will beat the highest mountain-climbing record, Sir W. M. Conway's 22,600 feet ascent of Pioneer Peak in the Himalayas. Dr. Gussfeldt has tried Aconcagua, but got into trouble with his guides and had to turn back 2000 feet from the summit.

Mechanical Progress.

The Jeffrey Mine Pump.

The pump illustrated herewith is a Jeffrey triplex mounted pump, especially designed for use in coal mines. It is operated by a ten-horse power waterproof motor, and has a pumping capacity of sixty gallons of water per minute against a head of 300 feet. The diameter of the cylinder is four inches, stroke six inches. The entire water end, plungers, valves, glands, etc., in fact, all parts which come in contact with the mine water, are made of composition metal. The pump is readily moved about the mines, which makes it possible to drain a large area.

It is of the type known as track-running dip pump, being of the triplex, single-acting plunger type, a construction that has been found best adapted for working in connection with electric motors, as it brings the most uniform load on the motor. The plungers are made of bronze and outside packed, the cylinders are all bronze-lined and the valves and all parts of the pump coming in contact with the water are made of bronze. This is considered absolutely necessary in a mine pump where the action of the water is so injurious as it is in mines. The principal advantage of this form of pump is that it can be taken from one portion of the mine to another for pumping out local sumps or dips. The suction end has a screened rubber hose attached to it, which is placed in the water to be pumped out. The discharge is connected either by means of long lengths of hose or straight connections to the main line of water piping. In other words, this pump simply takes the place of two or three men, mules and water carts which have in the past been used for taking the water out of these local sumps where it would not pay to pipe for steam and place a permanent pumping installation. Operators using these pumps say that it means a saving of from $6 to $8 per day.



THE JEFFREY MINE PUMP.

In a mine having an output of 500 tons per day, this is figured out as a saving of one and three-fifths cents per ton.

The Jeffrey Manufacturing Company of Columbus, Ohio, and Denver, Colorado, are the manufacturers.

The German export trade in barb wire to Japan is suffering greatly under the pressure of American competition. The Hamburg exporters are being forced to buy American barb wire, for their foreign customers have commenced to make their purchases in this line directly in the United States, thus evading the Hamburg middleman. Confronted by the alternative either to lose this trade or to buy American barb wire themselves they decided to take the latter course because they were afraid that the loss of this trade might result in the loss of trade in other lines, for it is a well known fact that business relations once formed will extend to other articles. Matters in the wire nail export are exactly similar. The Americans export wire nails via Hamburg to Japan at figures which the German wire nail manufacturers cannot attempt to meet.—American Manufacturer.

Electrical Progress.

At a meeting of the German-American Engineers at Pittsburg, Pa., September 5th, O. C. Reymann gave an account of the development of electricity as motive power on railways since 1879. Comparing the development of the steam and electric railways, he said that steam power was first employed on main lines, then transplanted to secondary and tertiary railways, and finally, though less frequently, to street railways. On the other hand, electricity first conquered the street railways and is now slowly forcing its adoption on railway branches and main lines. In 1887 there were in operation in this country only 13 miles of electric railway with 100 motor cars, in 1895 850 miles with 23,000 motor cars. Electric railways have proved a success in the suburban passenger traffic, and in their rivalry with the steam roads they are getting the better of the latter in this respect, owing to their greater frequency of trips and easier accessibility. On the main lines, however, great obstacles have to be overcome before the adoption of electricity as the motive power on such lines can be thought of. Tracks and bridges would have to be strengthened and straightened and the great expenses incurred would benefit for the present the passenger and mail traffic only, for there is no electric locomotive in existence that could pull a heavy freight train for long distances like the big mogul steam engines. Besides, there is very little prospect of a decrease in the coal bill. He then described the overhead trolley and underground or surface contact systems, declaring in favor of the latter for main lines, because the network of overhead wires in yards and on crossings and switches would be avoided. In conclusion, Mr. Reymann conceded that present electro-motive systems were not able to drive steam power from our main lines.

A number of railroads in the United States are contemplating placing electric headlights on the locomotives in place of the present headlights, but Theodore N. Ely, chief of motive power of the Pennsylvania Railroad Company, in speaking of the use of the electric headlight, said that the Pennsylvania railroad experimented with this system several years ago, and while it gave an excellent light, it would not answer the requirements, as on a two-track or a four-track road the rays from the locomotive coming in an opposite direction were so strong as to blind the engineer, and it would be some time before he got over it. Mr. Ely also said that of late years they have been reducing the size of the headlights for the locomotives. They were formerly 30 inches, but are now 16. Headlight oil, he thought, was more reliable and cheaper.

The syndicate of New York and Philadelphia capitalists which has been formed to construct an electric trolley railway between these two cities, has given out a contract for work that will cost $475,000. A power house, to cost $100,000, is to be erected near Bound Brook, N. J. The road, with all its branches, will be 1000 miles in length.

Practical Information.

Proposed Polar Exploration.

The expedition to Jones sound, planned for 1897, is intended to initiate a system of continuous Arctic exploration. Its object is to be the scientific research above indicated, and to this all else will be subordinated. Special attention will be paid to geology. Disasters having been plainly due to lack of a secure and always accessible base, the first object will be the establishment of a base at the mouth of Jones sound, which Julius von Payer calls "the one spot most suitable for such a base." Being in assured annual communication through the Scotch and Newfoundland whalers, a well housed and well provisioned party, with some Eskimo families, will be as safe there as anywhere on earth, and will have before it a field unequaled in richness and extent. To the north, the west coast of Ellesmere Land and Grinnell Land are to be explored; to the northwest, the triangle between those coasts and the Parry islands is to be rescued from the unknown; to the west, the interior of North Devon is an interesting problem; to the southwest, Prince Regent inlet may present an avenue to the magnetic pole; to the south, Baffin Land—with its Eskimo settlements, its herds of reindeer, its wealth in fishes and birds, its fossils and minerals—offers a tempting field, larger than the British isles. Even Greenland may not be beyond the sphere of that strategic point.

Such a system, once initiated, will cost very little. Lecturing tours and the sale of collections will defray a large part of the cost. Considering the enormous sums spent on Arctic exploration by governments and by individuals, it seems probable that when the system is once in running order it will not lack patrons. The cost of the initial expedition is estimated at $5000. Much smaller sums will probably suffice in subsequent years.

WITHIN a few months, unless some hitch occurs, will be begun the construction of the first railroad that has ever been built in Korea. It is to run from Seoul, the capital, to its sea port, Chemulpo, a distance of about twenty-five miles. The concession under which the railroad is to be built and operated was granted to an American, James R. Morse, and the road will be constructed with American capital and under the supervision of American engineers. Mr. Morse is the president of the trading company which carries on an extensive business in Korea. He was one of the first foreigners to enter the country, when it was first opened up in 1882, and he has spent a number of years there. He is on terms of personal acquaintance with the king, and about a year ago had the contract of placing an electric light plant in the sovereign's palace. He has recently obtained a concession for the working of several gold mines in the interior, and has sent for engineers from this country to develop them.—Railway World.

IN 1880 the birth rate per 1000 in the United States was 30.95. In 1890 it was 26.68, a decrease of 4.27 per 1000 of population in ten years. The decrease in the different States appears to have been nearly uniform. In Maine it was 3 per 1000; in New York, 1.65; in Pennsylvania, 3.30; in Indiana, 4.70; in Kansas, 5.67; in California, 3.72; in Louisiana, 5.50; in Texas, 9.47; in Kentucky, 4.90; in Georgia, 6.50; in Virginia, 7.76; and in other States in about the same proportion. The decrease was greatest in Massachusetts —11.67.

IT is often remarked, and particularly after the eruption of a volcano, that pumice stone ought to be plentiful and cheap, as quantities must have been ejected during the volcanic disturbance. As a matter of fact, however, none of the white stone in general use is obtained from active volcanoes. It comes from the deposits of the article discovered in one or two quarters of the globe, the best of which is at present to be found in the island of Lipari, situated in the Tyrrhenian sea. The island is mountainous in character and consists of tuffs and lavas, and of highly siliceous volcanic products. The district where the stone is found is called Campo Blanco or Monte Petalo, 1500 feet above the level of the sea.

ONE is justified in many cases in giving only a tentative belief to many of the big hailstone tales over which some travelers delight to spread themselves, says the *St. James' Budget*. A correspondent in Dholi, Behar, however, seeds the indubitable proof of photographs to quite convince us and our readers of the terrible nature of the hailstorm which occurred in his district recently. The storm passed over the greater part of the districts of Mozufferpore and Durbungah, but it appears to have concentrated itself with special fury over the indigo factory called Dholi. Here the storm was terrific, even for tropical regions, the hailstones weighing as much as five ounces. On an average they were as large, if not larger than cricket balls. It can be easily understood that the damage done was great. Not a whole tile was to be found in the roofs, trees were uprooted, birds were killed, and general destruction wrought all round. What is more astounding, the corrugated iron roofing over many of the factory buildings was riddled as if it had been shelled by a battery. We can quite imagine, as our correspondent informs us, that no storm like it has ever occurred in the district. Hailstones have, however, had the same terrific force in Africa, a sample of corrugated iron pierced in a like manner having been recently shown in London.

A PHYSICIAN advances the theory that the sensation of nausea has its seat in the brain and not in the stomach, and that relief may be obtained by cooling the base of the brain. He claims to have tested this often and thoroughly in the case of sick headache, bilious colic, cholera morbus and other ills in which the nausea is a distressing symptom, without a single failure; also that he once relieved the nausea resulting from cancer of the stomach by the application of ice to the back of the neck and occipital bone.

ACCORDING to the Cologne *Gazette* paraffine is found to be an excellent remedy for snake poison. The paraffine oil is worked thoroughly into the wound and then allowed to stand on it in a pool or the bitten part poulticed with paraffine.

CANADA proposes to erect a suitable monument to John and Sebastian Cabot at Bristol, England, to commemorate the voyage which these navigators took in 1497, which ended in the discovery of the Canadian coast.

ELEPHANTS in Africa are becoming so scarce that it is proposed to establish protected reservations for them on territory under British protection, like Somaliland.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

M. H. WALSH, Secretary and Manager. C. G. BACON, President.

Sonora Land and Mining Abstract Bureau.

Sonora, Tuolumne Co., Cal.

Abstract of Titles to all lands in Tuolumne County made under the Durfee Self-Correcting and Adjusting System.

Mining properties for sale or bonded on desirable terms. Correspondence invited from principals desiring investments in quartz mining properties or in the development of promising claims. Reliable information given on all matters.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.

Operator and Dealer in

Mines, Mining Properties and Mineral Lands,

Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES.

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $900,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

25,013 —DESIGN FOR GUITAR—C Knutsen, Port Townsend, Wash

NOTE Copies of U S and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order. American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CLASP FOR GARMENT SUPPORTERS.—Andrew Thomson and James Drever, San Francisco, Cal. No. 567,421. Dated Sept. 8, 1896. This invention relates to a clasp or fastening to be used in conjunction with a garment supporter, the clasp serving to secure the stocking or other garment and connect it with a supporting band or strap. It consists essentially of two interlocking sections, the lower end being bent into a hook with a narrow neck and a wide arched top, and the other in inverted U-form adapted to slip inside the tip of the first and interlock with the neck thereof; a plate with the opposite ends of which the upper ends of the two sections are pivotally connected, the intermediate portion of the plate being made concave so as to swing back between the sides of the first section when the two are interlocked, and in conjunction with this is a reflexible strap enclosing the plate and stitched thereto.

ADJUSTABLE SOCKET WRENCH.—Robert McDonald, Magalia, Cal., assignor of one-half to S. P. Low and G. R. Hendrix, same place. No. 567,405. Dated September 8, 1896. The object of this invention is to provide a simple and effective means for readily and accurately adjusting the jaws of a wrench to vary the space between them to suit different sizes of nuts. The wrench comprises a stock having pivoted to one end thereof opposing jaws provided with divergent extensions behind their pivotal centers, a sleeve adapted to slide upon the stock and engaging said extensions whereby the latter are moved to or from each other to cause the jaws to separate or approach, and a clutch nut-threaded on the stock and engaging the sleeve for adjusting it on the stock.

PUMPING APPARATUS. —Petar Frichette, Sheridan, Cal. No. 567,741. Dated Sept. 1, 1896. This invention has for its object the provision of simple and effective mechanism for applying the power by hand or a windmill or a horse-power requiring a reciprocating or oscillating movement, said application of power being made by means in the use of which any length of stroke may be given the pump rod without the employment of a crank and the consequent increase of power which follows an increase of said crank to provide an increased stroke. The pumping apparatus consists of a pump, the rod of which is longitudinally slotted, a roller mounted in said slot with its axis at one side of the vertical line of the rod, a horizontal shaft mounted in the frame of the apparatus, approximately in the vertical plane of the axis of the roller, a segment secured at its upper side to said shaft, a segmental cam passing through the slot of the rod and secured at one end to the shaft and adapted to impinge on said roller, a driving segment secured vertically in line with the driven segment, said driving segment being pivotally secured at its lower side, and having its upper side engaging the lower side of the driven segment, and means for oscillating the driving segment.

ALMOND SHELLER.—Alvinza H. Cope, Danville, Cal. No. 567,736. Dated Sept. 15, 1896. The object of this invention is to provide a machine which, while adapted for the shelling of various nuts, is especially adapted for the shelling of almonds, in which use its particular advantages are its adaptability to shell almonds whether or not the hull remains fast to the shell, the rapidity with which the nuts may be shelled, and the small number of kernels mutilated in the shelling process. The machine consists of a casing, open at top and bottom, a concaved grating formed of a series of parallel spaced metal bars, so shaped as to form downwardly diverging spaces, a rubber or grating over said concave having a curvature greater than that of the latter and having parallel spaced bars, said bars and the rubber and concave being adapted to split the shells of the nuts by the opposing crushing action of the edges formed along the bars at the junction of the inclined sides with the flat tops and bottoms. The driving shaft on which the rubber grating is mounted is vertically adjustable for adjusting the rubber closer to or farther from the concave, and said shaft is operated by levers on each side.

Coast Industrial Notes.

—The paper mill at Lebanon, Oregon, is to be lighted with electricity throughout.

—It is expected that the San Francisco and San Joaquin Valley Railroad will be ready for traffic out of Fresno by Oct. 1.

—The South Yuba Company expects to have the great reservoir dam above Clipper Gap completed in about six weeks.

—The last stone was laid on the new Parliament buildings at Victoria, B. C., last Saturday. Their cost will exceed $1,000,000.

—The Vance railroad in Humboldt county has been completed and the first train has been run over it to Samoa, the terminus, from which steamers will run to Eureka.

—News comes from Washington that a large amount of the $21,000,000 appropriation for coast and harbor defense, made at the last session of Congress, will be devoted to strengthening the defenses of San Francisco harbor.

—The Board of Supervisors of Sonoma county have granted a franchise for the building of an electric railroad from Santa Rosa to Sonoma. The new road will run through the Los Guilicos valley, via Melitta, Agua Caliente, Kenwood and Glen Ellen, thence to the Napa county line and on to the Embarcadero landing. Another line will be constructed from Santa Rosa to Healdsburg and other places. The Santa Rosa line is to be constructed in two years.

—The Union Iron Works of this city have secured an award of contract from the Navy Department to build a torpedo boat with a speed of 30 knots. Her dimensions will be: Length on water line, 210 feet; beam, 20 feet; draft of water, 6 feet; displacement in commission, 273 tons. This vessel is to be of similar type to the Desperate class, now being built for the British navy. It will require 5750-horse power to obtain the speed of 30 knots. The Union Iron Works have secured the right to build the Thornycroft boiler for this boat, and it will be built by them at their works. This vessel will have two tubes for launching torpedoes and a battery of six 6-pounder guns, will carry a crew of 56 men all told, and will be the first boat of her class built in Pacific waters.

Recent California Mining Incorporations.

Henrietta Mining Company, San Francisco; J. H. and R. W. Mastic of Alameda, J. A. Hennessey of Oakland, N. McGraw of Santa Cruz, M. B. Miller of San Francisco; capital stock $50,000, of which $25 has been subscribed.

Keystone Gold Mining Company, San Francisco; E. C. Loftus and H. M. Smith of Oakland, W. H. Clary of Stockton, J. M. Wright and G. D. Danskin of San Francisco; capital stock $1,000,000, of which $760,000 has been subscribed.

Specimen Gold Mining and Milling Company, San Francisco; R. F. Woods, J. J. Meyers, P. Diedesheimer, R. G. Hooker and W. E. Davis, all of San Francisco; capital stock, $500,000; paid up, $25,000.

Personal.

E. W. CHAPMAN of El Dorado county has been nominated for the State Senate.

FRANCIS HEURTEVANT, who is operating gravel mines on the Trinity river, is going to France on a visit.

BARON DE BATZ, owner of gravel mines on the Amoor river in Siberia, who operated several years in Montana, is in this city.

J. H. TIBBITS, who has been in Rhodesia, South Africa, for a year for an English syndicate, has returned to Sutter Creek, Amador county.

CHARLES D. WALCOTT, Director of the United States Geological Survey, is in the White mountains, in Inyo county, studying up Cambrian formations, and will come to this city before his return to Washington.

MARSDEN MANSON, chairman of the State Bureau of Highways, has received and will probably accept an invitation to attend the International Geological Congress to be held in St. Petersburg, Russia, in August, 1897. The invitation carries with it a pass over all the railways of the Russian Empire.

Recently Declared Mining Dividends.

Swansea, Utah, $5000.

Central Eureka, Utah, $30,000.

Bullion-Beck, Utah, $30,000.

Mercur, Utah, $30,000.

Cariboo mine, British Columbia; $16,000; a total of $111,000.

Isabella Mining Co., Colorado; $22,500, payable Sept. 25th.

Iron Mountain Mining Company, Montana, $5000, payable Sept. 25th.

Mammoth, Utah, $20,000; payable Oct. 1st. This makes a total of $1,110,000.

Commercial Paragraphs.

MESSRS. BIRCH & CO., 120-135 First street, in this city, are building a large Lightner quartz mill and other mining machinery which will be shipped in a few days to John Nation & Co.'s mine near Redding.

THE Hercules Gas Engine Works of this city are building a hoist for the Delaware mine at Nevada City, owned by McMurray and Martin, a hoist for Monroe & Birney of Sonora, and several gasoline pumping engines for mines.

THE Colorado Iron Works Co., of Denver, Colorado, are rapidly pushing to completion a 48x120-inch smelting furnace for the United Smelting and Refining Co., at East Helena, Montana. They have recently built and shipped to this same company two double-pot slag trucks.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

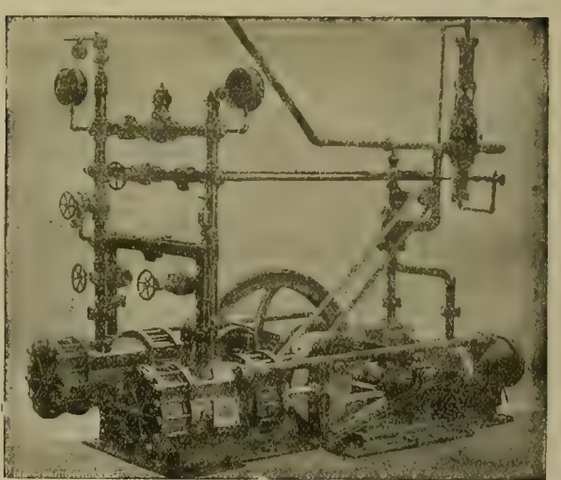
Eastern Office: No. 284 Pearl Street, New York

DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

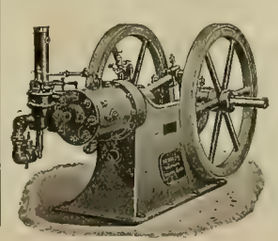
INSTITUTE FOR HOME STUDY OF ENGINEERING, 59-60 BLACKSTONE BLDG., CLEVELAND, O.

Hercules Gas, Gasoline and Distillate Engines.



Hoisting Engines 2 h.p. to 200 h.p. Stationary Engines 1 h.p. to 200 h.p. Marine Engines 2 h.p. to 200 h.p.

Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running. Just ½ your expense saved by using a HERCULES in place of any other. We make no exception.

Nearly 3000 HERCULES Hoisting, Stationary and Marine Engines in Actual Use. High Grade.

We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

WRITE FOR ILLUSTRATED CATALOG.

ESTABLISHED 1880.

Mining Summary.

CALIFORNIA.

Amador.

Republican: The El Dorado mine, formerly called the Mahon, which has been lying idle for some time, has been purchased by T. C. Mahon of Alaska, and resumed operations last week.

The Grover mine, which for some time has been shut down, will resume operations in a few days.

The Del Rey mine at Middle Bar has closed down, but will probably resume operations again about the middle of November.

The Boston mine, which employs about sixty men, will shortly close down for a month or six weeks, as they intend to sink a new shaft to the depth of 1000 feet. About fourteen men, including the foreman, will be retained to do this work.

There are fifty-two men employed in the Union mine at Pine Grove at present, and as soon as the extensive improvements on the 30-stamp mill are completed, quite a number more will be added to the list. The shaft is down 400 feet, and the ledge improves as they go deeper.

Ledger: The shaft at the Gwin is down 1375 feet. The cutting out for a 15,000-gallon water reservoir at the 1200 station is completed. There are reservoirs at the 300 and 700 for surface water and for water made in their shaft. The larger reservoir is to take the water from the old works, which is now draining into the new works from the hanging wall gouge at about 1195 feet. Mill building is progressing rapidly, ten carpenters being employed on the building.

The White Bros. are down 75 feet with their shafts, and have their pump in working order.

Republican: The Mechanics' mine has started up. It is proposed to put in a new hoist, shaft and mill.

The shaft of the South Eureka has now reached a depth of 1300 feet. The 20-stamp mill is running night and day in good rock.

The Central Eureka is operating the old Summit mine, one-half mile south of Sutter Creek. The owners have erected substantial hoisting works and will sink their shaft to a depth of 1000 feet.

Butte.

Mercury: The Faulkner group of mines at Forbestown have been bonded by capitalists from Texas, who will soon proceed to open them up.

H. P. Stow of Forbestown has purchased the Golden Queen quartz mine, which adjoins the Gold Bank.

Calaveras.

The Boston mine, near Mokelumne Hill, has added ten stamps to the twenty now in operation. A large quantity of low-grade ore is in sight. A new hoist has also been added to the works.

Citizen: Taylor brothers are opening their mine on San Domingo.

Fred McNear of the Iron Rock mine proposes sinking a shaft at the mouth of the tunnel recently run.

Experts have been prospecting the Pfortner & Burn's gravel mine and the indications are good for reopening.

J. W. Provard has been purchasing machinery in San Francisco preparatory to opening up the Reed mine near town.

Sullivan and Snedigar are preparing to operate the Cassinelli gravel mine at Central Hill on an extensive scale. A force of fourteen men are grading for the new hoisting works.

The old Star and Excelsior mine at Hog Hill which was worked in early days and considered rich in copper seems to be equally valuable for its gold-bearing quartz. Considerable prospecting on quartz has been done, the best indications being seen in the old copper diggings, which consist of two shafts, one of which is 126 feet deep and shows a well defined ledge over 6 feet wide.

At the Cuneo quartz mine, near San Antone camp, Frank Cuneo and sons are taking out good rock. They have a 5-foot vein, mostly sulphurets, which is improving as developments are being made.

The Basco mine, bonded to Montgomery and Requa of San Francisco, is showing a 4-foot vein in the tunnel, which has been extended 90 feet. The same parties are working the old Esmeralda, and will soon have the water all out.

The quartz claim owned by Antone Illich & Co. is about to be bonded, and it is expected work will begin on it immediately.

Terwilliger & Co. are putting in a flume on Tunnel hill, French gulch, preparatory to working an extensive deposit of old tailings which are said to prospect well.

Chronicle: The Esperanza Company will proceed at once with a three-compartment shaft to be carried down 1000 feet or more, on the site of the present working shaft, which makes it necessary to suspend work at the mill for the time being. When the shaft enlargement is finished to the 300-foot level it will then become practicable to continue sinking the shaft and again supply the mill with ore mined from that level and those above it.

Active operations are to be resumed on the Melones Consolidated mine, near Robinson's Ferry. W. C. Ralston will start work in the interest of Eastern capital.

El Dorado.

(Special Correspondence).—El Rio di Oro Mining Company are running a bedrock tunnel and placing 2000 feet of pipe on their recently acquired property 9 miles south of Placerville. This is a gravel plant. A. A. Wood is the superintendent.

J. W. Houston is working the river bed, employing thirty men at Murderers' Bar in the Middle Fork of the American river about 16 miles above Georgetown.

At the Ohio mine, one mile from Greenwood, a company of California people, incorporated under the name of the Greenwood Gold Mining Company, are progressing favorably. They began operations last March. Their shaft is 265 feet and they have drifted 250 feet. They operate a steam hoist. The property is on the Greenwood mother lode belt, and the formation is porphyritic slate. C. W. Keeney is superintendent.

Development work in the Kelsey district is moving along with good results. Three additional properties were added to the list on which shaft work is being rapidly pushed along.

The Welch mine, adjoining the Ohio near Greenwood, has been sufficiently prospected to warrant the company to incorporate, for which steps are now being taken. The company is composed of San Francisco people.

The tunnel on the Landeckers, two miles from Placerville, is being rapidly driven. This will be a gravel milling proposition.

Active work has been inaugurated on the Gentle Annie mime, the property recently bonded by T. T. Lane, two miles north of town, by sinking new shafts. At present two shafts on the Fortuna and one on Poverty Point are making rapid progress. There are fourteen claims in the group.

Despite the campaign our hotels are crowded by visiting mining men, both prospectors, experts and capitalists.

Placerville, September 21, '96.

Kern.

Californian: At Randsburg Smith & Senters are preparing to put in hoisting works on the Little Butte for the purpose of sinking to the 150-foot level, when they will begin drifting.

The Olympus mine, of Mooers, Singleton & Burcham, is down 100 feet, and they are drifting on the 50-foot level, on which a tunnel has been driven to the surface of the hill.

There is considerable dry washing still going on with good results. A Los Angeles company is arranging to put in a pulverizer and dry washer at the St. Elmo, which will handle 200 tons of earth a day.

The contract for sinking another well at the Garlock mill has been let and the work is now proceeding. It is estimated that, when completed, this will give additional water—enough to keep the mill running at its full capacity day and night.

Mariposa.

(Special Correspondence). — The Denver mine, near Haywards, S. H. Haywards and James S. Johnson owners, was inspected this week with a view to purchase by English experts. There is about 200 feet of tunneling along a very large, well-defined ledge said to average $3.76 in gold. The experts returned to San Francisco, taking samples with them.

Considerable work is going on at the Sellick mine at Haywards. Two shafts are down, one 50 feet, another 150 feet. The owners are W. E. Hensley (superintendent), W. E. Sellick, John G. Elliot and J. F. Clapp of Chicago. Extensive machinery has been ordered and the Sellick may now be regarded as something more than a prospecting show. The rock shows free gold in places, is heavily sulphureted and is easy to mine and mill.

Angus Mackintosh is in San Francisco making arrangements for machinery to start up the Triumph and Hayseed mines at Whitlocks. It is Mr. Mackintosh's intention to incorporate the property at an early date.

At the Louisiana mine, sixteen miles above Coulterville, A. C. Cable superintendent, steady development work is going on. The hoisting and pumping machinery is very substantial and the owners propose to go to a depth of at least 800 feet. Indications up to the present are so far satisfactory that a 10-stamp mill is to be erected upon the north fork of the Merced river, which is less than half a mile distant.

The Hites mine, at Hite's Cove, has been shut down for some time past. An incorporated company, of which John I. Minear was superintendent, attempted to reopen it, working under a bond. The time ran out and Mr. Hite would not give an extension. Parties have been visiting it lately with a view to securing a working bond from Mr. Hite. There is a very large and complete plant on the ground, including forty stamps. This property has exceptionally cheap water power from the Merced river.

Colonel Trevelyan of Fresno has returned from England. Before his departure he secured nearly a dozen claims in the Sherlocks district. It is now stated that extensive prospecting work is to be begun.

A few prospectors are working on the Mariposa grant, but there is nothing of importance to chronicle.

The Mariposa Electric Power Company has men at work on its new ditch from Broadhead to Benton Mills.

No work is at present going on at the Red Banks.

Coulterville, Sept. 23, '96.

Miner: On the Reynolds mine two drifts are being run on the 100-foot level and a good vein of quartz is in sight.

The two mines known as the Independence and North Fork, owned by Joseph Adams, have been bonded to Mr. Donaldson of Coulterville. Development work will soon be commenced.

Three of the directors of the Merced Gold Mining Company are here making an examination of the property. They are C. H. Palmer, Butte; J. A. Coram, Lowell; J. F. Moffett, New York. They are accompanied by T. C. Gorrie, a mining expert, who was spoken of some time ago as the new superintendent of the M. G. M. Co., and C. Allen, superintendent of the Boston and Butte smelters, at Butte.

A hoisting plant is reported to be put in place soon on the Never Sweat mine. The showing made by the mine so far is very gratifying to the owners, and they are confident they have a first-class property.

The Tyro is still running steadily on good pay rock. The last reports are to the effect that rich ore in considerable quantity is being uncovered.

Nevada.

Union: The W. Y. Q. D. Mining Company advertises for bids to sink a shaft 200 feet on the Parr ground, adjoining the W. Y. O. D. on the east. In the early days considerable gold was taken from the Parr ground.

Transcript: Negotiations are pending for the transfer and reopening of the Texas mine. The property consists of 160 acres of patented ground. There are four parallel veins, all of which have been worked more or less to the depth of 70 feet. A good deal of money first and last has been taken out. A portion of the big Blue vein, so rich in the Murchie mine, runs through this property.

Placer.

Colfax *Sentinel*: A new quartz mill will soon be erected at the La Trinidad mine, in Sailor canyon, sixteen miles southeast of Cisco.

The Nissen quartz mine, near Colfax, on the Forest Hill road, has closed down temporarily owing to the death of one of the parties who have a working bond upon it.

The Eureka tunnel is now in 1650 feet. This leaves only 350 feet remaining to the point where gravel will be reached.

San Bernardino.

Sun: J. M. Crawford and J. H. Mason went up the wash on Lytle creek with a dry washer, more for the purpose of testing the washer than any idea of securing gold. They went to a place where placer mines had once been located, set up the machine and for two hours worked what were supposed to be tailings. They were surprised to find that the cleanup for this short run brought out $3.60 worth of gold.

San Diego.

Ramona *Sentinel*: Bailey Bros. are working on good quartz in the Redmond mine.

A force of men has been put to work at the Gold King mine.

The concentrators are in place at the Owens mill and everything is in readiness to start crushing ore.

Matt Werner has discovered a rich body of ore in Boulder creek, between Stonewall and Julian, in the heart of the mining country, and the spot has been passed over for years by prospectors.

Shasta.

Free Press: Joseph Thompson and sons, lessees of the Mammoth mine at Old Diggings, have encountered a rich ore vein twenty inches wide in their 100-foot drift. The mine is located near the Hart mine.

Two new tunnels and one shaft have been started at the Garfield mine, at Rich gulch, new timbers are being placed in the old tunnel, and some new building done.

Courier: There will soon be a new mill up French gulch, with 400 tons of rock from the Brunswick mine to start on.

It is reported that the new smelter at Keswick turned out more matte the first four or five days it ran than the first smelter did during all the time it was in operation.

Forty-three years ago the new placer mines at Pittsburg and Elizabethtown, near what is now Copper City, were booming.

There has been hauled a lot of ore from the Coleman estate mine near Fort Dingee to the Keswick smelter.

Sierra.

Mountain Messenger: At the Slug Canyon mine the contractors have completed their work. Mr. Copeland is still driving the tunnel ahead as rapidly as possible with eight-hour shifts, and is nearing a point where he expects to strike the ledge.

E. N. Polley's hydraulic mine at Brandy City is fitted up and ready for next season's water.

Siskiyou.

Journal: The Colorado company, which recently purchased the old Shinar mine on Thompson creek, have about forty men at work on their ditch, which is to be about three miles long.

The French mining company on Wild Cat creek have not been working their mine for some time, owing to a want of sufficient water. They expect to build a ditch soon, which will furnish them with all the water they need. The owners are also interested in the extensive French mine in Trinity county.

It is reported that the mines down on the Klamath are showing prospects of a successful season. The weather has been favorable to working this year, and under good management most of them should pay well.

Journal: The Chamberlain & Timmons mill on Mill creek will be completed this month, and they will commence crushing rock from the Mabel mine, on the divide between Oak bar and Scott bar, the 1st of October. They now have about 200 tons of ore on the dump.

The Hiatt, Garrette & Co. Gravel Mining Co. of Yolo county have finished a large wing dam in the Klamath, below the mouth of Scott river, and, with a force of 26 men, are running day and night, washing the top gravel, which pays well.

The placer mines in the Salmon River country will be started up just as the fall rains furnish sufficient waters. W. P. Bennett has several mines near the Forks of Salmon river which will be opened up in a short time.

Trinity.

Journal: The Poker Bar machinery is all up. The mine will start in a few days.

Tuolumne.

Union-Democrat: The Black Oak district northeast of Sonora is alive with prospectors and owners of hitherto vacant or abandoned claims. A success has been made of the cyanide process at the Black Oak mine. The Dead Horse, Confidence, Belleview, Lady Washington and several other properties in that belt are coming to the front.

At the Mammoth on a level being driven from the winze which is being sunk from the end of the main working tunnel, a large body of rich ore that has every indication of being permanent has been struck.

B. M. Newcomb, the general manager of the Santa Ysabel, arrived last week to accept from the contractors the new power machinery just erected at the mine. It is reported that while here he will arrange to start work on Whiskey Hill and increase the present force at the Santa Ysabel.

Richard Chute, of the Rappahannock mine, is working a large crew on development work.

Work on the Eagle tunnel has been resumed, the water in the shaft recently tapped having all escaped.

The owners of the Hibbin mine in the Black Oak district are arranging to start work on the shaft. It has been abandoned for some time, but will run steadily this winter.

Independent: The Tarantula has been sold for $10,000.

A pocket of $1500 has been taken out of the Fuchs mine at Saw Mill Flat.

NEVADA.

H. A. Miller has discovered a gold-bearing lead in Pyramid district. He has uncovered the lead in a number of places a distance of nearly 1000 feet. It is about a foot wide, and there are streaks in the vein which are rich in gold. The ore is decomposed and slightly stained with copper.

At Tuscarora, since the resumption of work upon the property of the Dexter Mining Company, under its reorganization, a force of some fifty men has found employment in the mine and mill. The cyanide plant which has been put upon the ground is working well.

Negotiations are pending for the sale of the Tono Rose group through Salt Lake parties, with Colorado capitalists as the purchasers.

Territorial Enterprise: The Buckeye placer gold mines, about thirty-five miles from Carson, are comparatively idle at present, from lack of a good supply of water to wash with. Next winter they will have much better and more extensive arrangements for water supply, storage and sluicing. C. D. Lane, who offered $250,000 for these mines, was here last Monday on his way to Dayton to look at the La Grande Oro gravel mine.

The Zirn mine at Pine Nut will start up again. It is a quartz gold mine and some portions of it have yielded rich ore.

Logan & Hully's mine, twenty miles east of Carson, is actively working. It is principally a gold mine.

At Pine Grove, some seventy-five miles south of Carson, Wilson & Sons are working their quartz gold mine more effectively and productively than ever before. There are about fifty men working in the camp. The Wilson mine has been working with varied success for the past thirty years.

La Grave & Gardner's recent mining discovery up in Douglass county, at the foot of the Pine Grove range, is having a prospect shaft sunk upon it, and a sample run of the ore will soon be extracted for a practical milling test. It shows rich in native silver and gold.

At the base of the Sierra Nevada, in one of the ravines that flow into the head of the Washoe valley, Leyman Jones is washing out gold with a rocker, making $3 or $4 a day.

Silver State: The new mining district of State Line, on the boundary between Nevada and Utah, embraces an area 6 or 7 miles wide by 12 long. It is about 15 miles from the old grade of the railroad from Milford. Nearly all the ground within this district is located by cowboys and ranchmen, who hold their claims at figures ranging from $50,000 to $200,000 each. There are about 100 men in the district prospecting and working claims. The mineral-bearing zone consists of a silver vein lying between porphyry. Some of it is very rich and carries from 500 to 600 ounces of silver. The gold is found in hard quartz and is a free-milling ore. It runs from $10 to $12 per ton. Most of the prospects are in the gold-bearing vein. The district has an elevation of between 7000 and 8000 feet, and there is frost every month of the year. Timber is abundant, but there is not enough water yet for milling purposes.

OREGON.

Telegram: Two groups of copper mines in Josephine county, at the headwaters of the Illinois river, close to the California line, have been thoroughly developed by Baltimore capitalists at the expense of $475,000. They are perfectly satisfied with the results attained, and had commenced to reduce ores, but found that they needed some additional furnaces to make a perfect success, and are now putting these up, and will in a few weeks be turning out at least ten tons of copper a day. The Siskiyou group covers 500 acres and is 35 miles from Crescent City. The Elmer-Brown ground is near Waldo. The same parties own both mines. These are 30 and 20-ton plants and there are 1500 tons of ore waiting reduction that has 25 per cent copper. There have been tunnels driven into the mountain 800 feet on one side and 600 on the other.

WASHINGTON.

Snohomish *Tribune*: M. Montan and L. Lundelin have completed a sale of the Billy Goat, Grizzy, Atha and Grizzly Extension claims to the Clear Creek Copper and Gold Mining Company. The property lies north of the famous Helena. The ore assays 10 to 40 per cent copper, $13 to $40 in gold and $5 to $6 in silver. The purchasers have formed a corporation with a capital of $600,000.

BRITISH COLUMBIA.

Kootenaian: There has been considerable excitement in Kamloops over the discovery near that place of mineral deposits. The first discovery was made about six months ago, since when about sixty claims have been located. The formation is diorite mixed with eruptive rocks, and is much broken by porphyry dykes. Topographically, and in the character of its mineral, the country bears a

striking resemblance to Trail creek, the ore being seamed along a series of fissures, with a northeast and southwest trend, which has been followed for a distance of three miles. The mines can be easily worked, being near the railway and easy of access.

Nelson *Tribune*: The Josie No. 2, a free-milling property south of the Poorman, has been bonded to a Minneapolis syndidate for $30,000, a first payment of $6500 having been made.

Spokesman-Review: In the Methow country the Red Shirt property is under lease to an English syndicate, and they are putting in a 20-stamp mill.

A strike is just reported on the Delaware at Rossland, northeast of Jumbo. The ore is an iron sulphide in a quartz gangue.

The owners of the Cariboo mine at Camp McKinney, B. C., contemplate putting in five additional stamps in their property, making fifteen in all.

The Rosiyn Gold Mining Company, with head quarters at Spokane, has been incorporated with a capital stock of $1,500,000.

Spokane *Chronicle*: At Lookout mountain, Rossland, the Little Giant group, consisting of the Little Giant, Copper King, Little H. and Little Vitte have been sold to William Bennison of Everett, Wash., for $25,000 cash by Charles Northridge, Charles Bates and W. Hornshoe.

The Prince of Wales group on Lookout mountain, Trail, has been sold to an English syndicate for $50,000 cash, which has already been paid and transfer made. The claims consist of the Prince of Wales, E. V. Debs and Emma R.

Ashcroft *Mining Journal*: On the Bonaparte river, about sixteen miles north of Ashcroft, 400 acres of ground has been located for mining purposes by the English syndicate.

A. J. Hughes and A. R. Code, from Manitoba, have formed a company to stock the Brindle group of five claims, the Mount Mabel Mining and Smelting Company, Limited, with a capital of $1,500,000.

Work has been suspended on the Mountain Chief until a compressor plant can be put in operation. This property has shipped over $100,000 worth of ore.

ALASKA.

Alaska News: The Julian Mining Company have milled over 400 tons of $10 ore since their new mill began operations. Between 300 and 400 tons yet remain on the dump.

Last fall what is described as a mountain of quartz was discovered and located three miles above Forty Mile and a mill test of several tons has been sent to San Francisco. The ore is free milling and several assays have given returns of from $7 to $11 per ton in gold. Should the test prove satisfactory a stamp mill will be taken in this fall and erected.

Early this year two ledges of gold-bearing quartz were discovered on the hillside on Gastineau channel about 1000 feet above tide water and directly opposite the Treadwell mines. These ledges are in width respectively 20 and 50 feet and are running with the formation, having well defined black slate walls. Ten men have been put to work on the ledge, a contract having been let to run a 4x8 tunnel 100 feet which will crosscut both ledges.

The B. B. M. & M. Co., is putting in a gravity wire tram from the upper end of the Bear car tram. It runs diagonally up the side of the mountain at an angle of 22½° and is to be used to convey ore from the Northern Belle to the mill. There are no towers and as the distance between terminals is 3100 feet it will be the longest single span in Alaska. The tram will have a carrying capacity of 300 tons in ten hours.

The Ebner Gold Mining Company will order an additional five stamps for their mill now in operation in the Basin.

Eighteen miners are now at work driving tunnels, stopes and crosscuts on the Northern Belle, preparatory to opening up the mine. Considerable ore has already been taken out and it is thought the mill will shortly resume operations.

IDAHO.

It is reported that the Petit mine at Atlanta has been sold to a French syndicate for $250,000. The owners are all residents of Boise.

The Bear Creek Alluvial Gold Mining Company, a Scotch corporation, has completed its outfit for placer mining in Rocky Bear district. A double 4-foot flume, 3000 feet in length, has been constructed: a car track has been built along the creek, upon which a derrick is moved that can lift seven tons of debris at each load. The latest approved apparatus for saving the black sand has been brought into use. The company owns five miles of virgin placer ground lying just ahead of the works.

It is reported that the Florida Mountain Mining Company has closed a deal for the Humboldt mine on Florida mountain, the property of John Feour and Taylor Gearheart. The price is reported to be $100,000 cash.

De Lamar *Nugget*: The large brick tank placed in the annex of the De Lamar mill is being removed, and will be replaced with small wood tanks of two tons capacity each, constructed upon quite a simple plan. These tanks will be 9 feet in interior diameter by 4 feet in height, and will contain a simple four-armed sweep with plates of boiler iron beneath each arm to serve as anodes for the electric current. The cyanide solution will be charged into the pulp in the tanks, which will have copper-lined bottoms, upon which will be a bed of quicksilver, which will constitute the cathode of the current. The pulp solution, when its value has been exhausted, will be drawn off through a plughole in the side of the tank. The quicksilver will remain upon the bottom until a number of charges have been made, when it will be drawn off through the bottom as often as a cleanup is made. Each tank will contain a two-ton charge every twelve hours, or four tons a day. Only two tanks will be put in at the present time, but if they prove satisfactory twelve more will be added, that number covering the foundation provided for the brick tank now being removed. A plant with two tanks, constructed on the same principle, is now in successful operation in Boulder county, Col., and another at the Old Faithful mine in Montana.

The De Lamar mine has paid some $40,000 per month in dividends during the past six years.

The Trade Dollar is producing from $60,000 to $100,000 a month.

UTAH.

(Special Correspondence).—The Mercur Mining and Milling Company are doubling the capacity of their cyanide plant. This will increase it to 450 tons per day.

The Sacramento Company are increasing their milling facilities to 120 tons per day. This will make the total daily output of this camp 750 tons.

Inside of thirty days we expect to see three more mills under construction.

The drill hole on the East Golden Gate mine is still going down at the rate of 20 feet a day and has now attained a total depth from the surface of 1000 feet.

The Wonder, Hecla and Seals, all of which have struck the 400-foot mark, and are located north of the Golden Gate, are still sinking and expect every day to strike pay ore. The Brick Yard, which lies between them and the Golden Gate, already has ore in half a dozen shafts, inclines and tunnels, and has enough blocked out to justify building a mill, which the management state they will commence grading for within the next thirty days.

It is reported that within fifteen days work will be commenced on the grading for the Golden Gate mill of 400 tons daily capacity.

The Northern Light Company, who have a large body of gold and silver ore, will start on their mill within thirty days.

Mercur, Sept. 21, '96.

Tribune: At Mercur a reduction in wages took place at the Sunshine mine last week. The shovelers were reduced from $3 to $2 50 per day. As an offset their board was reduced from $1 to 75 cents.

The Wonder is getting into a little softer formation and is down 412 feet. At every two feet samples of the ore are kept so that a perfect record can be seen of the formation from the top to the bottom of the shaft.

Owing to the low price of metal there will be no shipments of ore for the present from the Northern Light. The ore body is well blocked out so that an abundance of material can readily be got out as soon as the new mill is erected.

The Mercur mine is now working ninety-three men.

The Hecla is down 460 feet. After going through 22 feet of yellow porphyry they have got into about 5 feet of darker formation which has a more promising appearance.

The Malvern Company is developing its group by a drift from the 600-foot level of the Sunshine, which the latter has already extended 250 feet on high-grade milling ore. The Malvern Company will continue the drift for 400 feet on the strike of the vein into its own ground.

The Bullion-Beck is now marketing about 100 tons daily and treating nearly double that amount at their mill. The rich strike of ore reported recently on the 700 level is showing up in magnificent shape and has fully doubled in width, at the same time maintaining its high values.

The force at the Sunbeam is to be doubled at once and preparations are being made for a shipment of good copper-silver ore within a short time.

A European syndicate has procured a bond on the property of the Winnamuck Mining Company. The price is said to be $100,000.

At a meeting of the Board of Directors of the Peruvian Mining Company it was decided to put a tunnel in 500 feet to intercept the vein upon its dip. For this purpose the Board decided to levy an assessment of 4 cents a share, payable at once.

At Park City the reports from the Comstock are better than ever. Two good bodies of ore were encountered last week.

Seven hundred feet more of excavation and the Ontario tunnel will tap the works of the old Daly in the 1700-foot level.

The Crown Point shaft is now 165 feet deep.

Some samples of ore from Ashley valley, near the Uintah reservation, show copper running as high as 60 per cent, while associated with it are twenty ounces in silver. The owners are now employing about thirty men, and are shipping to Denver.

WYOMING.

It is reported that a discovery of gold ore has been made in Grand Encampment creek, forty-five miles southeast of Rawlins, Wyo.

Rock Springs reports state that E. A. Green of New York is having a survey made of placer property at Oregon Buttes, Carbon county, with a view to purchasing the property, which includes 5,000 acres, if water can be put upon it.

MONTANA.

Butte *Miner*: The Hope mine, recently purchased by Eastern parties, has started up with thirty men. The management is getting ready to sink a new shaft. The old shaft is to be cleaned out and used as an air shaft. Plans have been prepared for a new concentrator.

Reports have come in of rich strikes in the placers in Wisconsin creek. A company has been formed to bring a 35-mile ditch from the south fork of the Madison to work deposits on the Big Baldy.

Inter-Mountain: At the Anaconda, High Ore No. 2 shaft has reached a depth of 1,365 feet, and work is being actively pushed on a tunnel which will connect the 1200-foot level of the High Ore with the 1000-foot level of the Modoc. The running of the tunnel is a part of the programme of the Anaconda company which a long time ago started in to connect all of its properties to prevent accident in case of fire or other disasters, and when the Modoc connection is made a person may decend the Buffalo shaft on the west and traverse the whole length of the Anaconda company's possessions.

Advices from Boston indicate that the Butte & Boston reorganization scheme will be carried out at once. Mr. C. W. Goodale, who had been appointed to make an examination of the properties here, sent in his report some days ago and it is believed has been acted on. Some definite action is looked for within a few days.

SOUTH DAKOTA.

Black Hills *Times*: Another chute of ore has been discovered in the workings of the Kickapoo property, on Yellow creek. It was struck in the main tunnel, now in about 140 feet.

The upper ore contact recently discovered on the Tornado group has been opened on various points on the surface and its continuity proven for a distance of about 800 feet east and west and 400 feet north and south, and is evidently the same contact that is exposed in the Fannie shaft at the 80-foot level and in the Tornado workings.

The Union Hill stamp mill, in Galena, is crushing 30 tons of ore per day.

The Elkhorn Railroad has located and secured right of way for the new shaft to the Tornado workings. It will connect with the Harmony, on the Fantail side of the hill.

COLORADO.

Denver *Republican*: At Cripple Creek the Empress of Japan Company has started a new shaft on the line established for the vein to follow by the development in the Arcadia.

The new vein cut in the drift from the 300-foot station at the E. Porter Gold King has been drifted on for 50 feet and the character of the ore seems to establish that the vein is the same one found in the Anchoria-Leland ground as was believed when the strike was first made.

The Geneva on Gold hill is producing about 50 tons of $40 ore a week. Tutt & Penrose, the lessees, have done about all the dead work their lease calls for, and in a short time will put all the men on ore.

T. L. Cotton has taken a $15,000 bond and lease for eighteen months on the Magdalene on Gold hill from Nathan & Co.

The 400-foot level on the Moon-Anchor on Gold Hill, has penetrated the ore chute for a distance of 40 feet, and finds the ore in that level to be fully six feet in width, the grade averaging $60 and sorted into two grades.

The adit tunnel on the May Belle lease on the Lawrence townsite has progressed 20 feet into the new ore chute entered a few days ago and values continue. Some ore is now being sorted into two grades, estimated to run $200 for the first and about $40 for the second.

Dolf, Odell & Mohrbacker have taken a bond for $20,000 and lease for one year on the Electric, located in the saddle between Gold and Globe hills.

The London and Colorado Gold Mining and Exploration Company organized under the laws of the State of Colorado, with main offices in London, has secured leases and claims in Gilpin, Clear Creek, Lake and El Paso counties, and orders have been received from London directing the agent of the company in Colorado to send a force of men to Cripple Creek, where the company has secured from the Queen Victoria Mining Company sub-leases on two lots in the school section in Grassy gulch, which they propose to develop.

NEW MEXICO.

Silver City *Enterprise*: About twenty men are employed in the mines of Chloride Flat. Several men at work screening the old dumps and fully 1,000 tons of ore has been produced from this source during the past three months.

At Pinos Altos on the Talcose group of mines, formerly owned by Wm. Dorsey, fourteen men are at work.

The Golden Giant Mining Company have about fifty men employed in the mine and mill. The ore in this vein appears to increase both in quantity and quality as depth is attained.

The Bayard Mining and Smelting Company which purchased the Texas and other mining properties at Central, have paid the first installment of the purchased price. The new management has taken charge and men are at work.

At Santa Rita twenty men are employed in the mines of the camp, mostly as leasers, producing copper ore which is being shipped to the reduction works.

Weatherby & Banks have recently given a two years lease and bond on the Florid group of mines to Mr. Bell of Chicago who is said to represent a strong syndicate of English and American capital.

ARIZONA.

Yuma *Sentinel*: R. M. Strauss, superintendent of the La Fortuna mine, came in Sunday with $75,000, the result of a six weeks run.

It is rumored that a French syndicate will shortly purchase the La Fortuna mine for $1,500,000.

Nogales *Oasis*: The quality of coal found on the San Carlos coal fields is said to be excellent. The only question now to be determined is the extent of the vein.

The ten tons of ore from the McMahon lease on the Nighthawk gave a return at the sampler of nearly 7000 ounces silver and 20 ounces gold.

A new reduction plant is to be erected at Fool's Gulch, Yavapai county, by the company operating the Planet-Saturn mines. It will consist of Cornish rolls and a cyanide tank.

F. R. Nellis and a force of men will soon leave for the copper mines six miles from Rain Tanks. These mines are owned by a syndicate of Williams business men. The ore runs from 20 to 70 per cent copper.

Mojave *Miner*: There are eighteen men at work on the Elkhart mine at Chloride for the Improvement Company. In the level from the 140-foot station a big body of lead ore has been encountered.

The strike reported in the Metallic Accident is improving daily. The find is in the old workings near where the rich body was taken out twenty years ago by the late Thomas J. Christie.

SOUTH AFRICA.

South African *Mining Journal*: That the onward progress of these fields is not to be lightly stayed has been demonstrated in the plainest manner by the output for July, which was on Monday last declared at 203,874 ozs., which is the highest on record, overtopping the August record of last year by 301 ozs., the total for that month having been 203,573 ozs. This result has, it may be roundly asserted, been gained by the sheer extra weight of working stamps, which, in spite of all troubles, have been steadily added to the list; for, as compared with the conditions which prevailed at this time last year, the mines just now are working at a distinct disadvantage, and especially so in the matter of the coal supply, which on many properties has given more trouble during the past month than during any other preceding period. Thus, comparing the month's run with that of August of last year, the average running time for that month was 28.18 days, while for this July the average running time for the mines sending returns to the Chamber was only 27 65 days, and for the Association it was even less—26.30 days—these low figures being mainly due to the coal difficulty. This short running time is, however, balanced by the fact that, whereas in August of last year the number of stamps was 2565, for this July the total has been 3060.

The value of the gold from the 34 companies adhering to the Chamber is £580,080, and from the 11 companies adhering to the Association £116,616, giving a gross value for the output of £696,696, or at the rate of over £8,000,000 per annum. The duty per stamp per day for the 2365 stamps of the Chamber return was 4.38 tons and for the 695 stamps of the Association 4 tons.

The position of the leading companies as regards the value of their output is as follows:

		July.	*June.*
1.	Robinson	£57,401	£63,620
2.	Ferreira	39,478	39,103
3.	Crown Reef	36,928	35,755
4.	New Primrose	36,669	33,994
5.	City and Suburban	31,902	29,276
6.	Simmer and Jack	30,915	28,491
7.	Langlaagte Estate	26,500	28,300
8.	Geldenhuis Estate	23,077	22,406
9.	Henry Nourse	23,695	22,883
10.	New Heriot	20,705	20,701

It is pleasant to note that the Geldenhuis Deep is beginning to run close up to this list, and in all probability another three or four months will give it a place on the table of the leading mines. The value of its yield for July is returned at £17,473—a large increase over that for June.

Lifetime Furniture.

Furniture should last a lifetime; it will if rightly bought.

Economy isn't buying the cheapest you can, it's getting a good money's worth.

A Bedroom-Set Hint:

Like picture, solid oak, carved and polished; Cheval dressing mirror—large glass; wash stand to match (no picture).

$24 is the price.

DEWEY & CO., 220 Market St., SAN FRANCISCO, PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

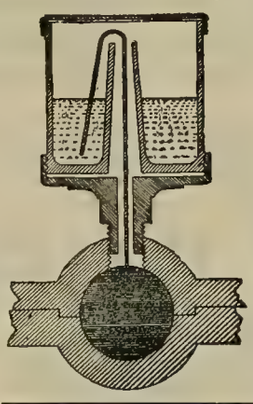
Positively Reduces Oil Bills 75 Per Cent.



THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

K. J. McHUGH, 25 New Montgomery St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { **Brown's Complete Automatic Mill Process.**
Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

~MANUFACTURERS OF~

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

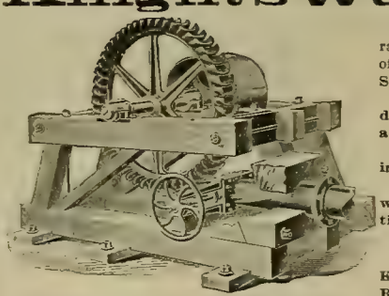
Knight's Water Wheel.



For full particulars, send for descrip [illegible]

The accompanying cut shows the general arrangement of Knight's Standard Water Wheel, of which there are hundreds in use in different States of the Union.

These Wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.

Wheels inclosed in iron cases, from 6 to 24 inches.

Wheels for electrical power can be furnished with or without Governors. Highest regulation guaranteed.

Address all communications to KNIGHT & CO., Sutter Creek, Cal., or, RISDON IRON WORKS, Agents, San Francisco, Cal.

IRON & STEEL WATER PIPE & WELL CASING

Mining Pipe

For Hydraulic Purposes, made from the Best Sheet Steel, Single or Double Riveted, Dipped or Undipped.

We will ship Pipe cut and punched, to be riveted at the mine, making a saving in freight charges.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 24, 1896.

The demand for winter stocks is steadily enlarging. In the gold mining districts the purchases are reported to be larger than at the corresponding time in 1895. This increase is due to more miners at work. From the lumbering camps and most of the agricultural sections the call does not show any material change. An improvement in the market value of wheat has created a better feeling, which would be more in evidence were it not for the fear that prices have been advanced largely on a speculative bull move on short sellers. While this may, to some extent, be the case, yet the statistical situation of the cereal the world over is favorable to better prices throughout the current season than have obtained for several seasons. With farmers doing better and a continued boom in mining, this coast ought to be entering on a more prosperous season.

The securing of a contract to build a battleship in this city, with an almost certainty that the building of one of the cruisers will be awarded to San Francisco, ought to have a good effect. Added to this there is a strong probability that one or more of the large iron steamships to be built by the Japanese company, to ply between this port and Japan, will be built here. The financial agent of the company has been here looking over the field, then went East and is now in Europe. The New York *Journal of Commerce*, commenting on his movements, thinks that San Francisco will be awarded at least one of the vessels, the East get one or more, and England the others.

In the local money market the available supply of funds is steadily increasing, but the banks are slow in putting it out except on gilt-edge security on call or short time. The impression is growing that soon after the Presidential election this will change and lenders will be seeking borrowers. Those who have drawn their funds from banks for hoarding will tire of having idle money, and will therefore seek investment. The banks are holding large quantities of gold coin brought from the East. Aside from this, it is said they can again get coin from the sub-Treasury in this city, so they are resting easy. The Eastern markets are working easier under continued heavy importations of gold from Europe. This influx is chiefly to meet commercial bills drawn against shipments of cotton, wheat and other American products. The balance of trade is largely in this favor; and as European investors are not selling our securities, it is not at all unlikely that the flow of gold to this country will continue for some time to come, which means better times in this country. As yet, there is an absence of a general speculative movement. The European markets are working closer, with the rates of interest advancing and premiums on gold enhancing.

New York Silver Prices.

NEW YORK, Sept. 24.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	30 7-16	65⅞
Saturday	30⅝	65⅝
Monday	30¾	65¼
Tuesday	30⅜	65⅜
Wednesday	30½	65½
Thursday	30⅜	65½

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 77½	10 25@12 50	13 00
Saturday	10 70	2 77½	10 25@12 50	13 00
Monday	10 70	2 77½	10 25@12 50	12 95
Tuesday	10 70	2 77½	10 25@12 50	12 95
Wednesday	10 75	2 80	10 25@12 50	12 90

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	10
New York Telegraphic Transfer	15
London Bankers' 60 days	$4.83
London Merchants	$4.82
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	65¾
Mexican Dollars	51@51½

SILVER.—The market sold down up to Tuesday, when it began to firm up. There is a fair export movement from New York to Europe. The European markets are reported more or less dull, with a continued light movement to India, the Straits and the Orient. Light as is the call, still stocks in this country and abroad are said to be slowly decreasing. Our European exchanges report that dealers are watching with keen interest the election campaign in the United States, which they think will have quite a direct bearing on the market value of the white metal. The miners' strike at Leadville will, it is thought, curtail the production in this country. In our market very little business is reported.

MEXICAN DOLLARS.—The market is devoid of interest in the absence of much of an inquiry. Quotations are largely nominal.

COPPER.—The market has held steady both in this country and Europe. For the seven months ending with July the imports into the United States were as follows: Ore and regulus, tons, 1895, 8,070; 1896, 1,415. Pigs, bars, ingots, etc., pounds, 1895, 2,906,012; 1896, 6,474,696. The export of copper during the same period were in 1895, 78,110,642 pounds and in 1896, 142,476,307 pounds. James Lewis & Son, under date at Liverpool, Sept. 1st, report: "Manufactured copper has been in much request. Electric lighting and traction is rapidly extending. The telegraph department of the post office have contracted for about 700 tons of high conductivity wire, and have laid two telegraph wires of copper between Glasgow and London for the more rapid transmission of messages. For locomotive plates and tubes manufacturers are full of orders up to the end of the year. It is stated that one of the chief locomotive engineering firms in Scotland have orders booked that will fully occupy them for eighteen months. American producers have displayed great anxiety to sell their copper, especially electrolytic. Advantage has been taken of this by both English and Continental consumers to secure considerable quantities at very low prices."

The market is quoted as follows:

Ingot, jobbing	—	@	14
Ingot, wholesale	—	@	13
Sheet copper	—	@	17

LEAD.—The market is steady, with the stocks in this country being steadily depleted. For the seven months ending July 31st the imports into the United States were in 1895, 105,097,393 lbs., and in 1896, 94,732,086 lbs. The export movements during the like time were as follows:

	1896.	1895.
Foreign produce, lbs	53,757,375	16,132,145
Domestic produce, lbs	8,206,950	884,593

Our market is quoted as follows:

Pig	—	@	3 65
Bar	—	@	4 00
Sheet	—	@	5 25
Pipe	—	@	4 50

ANTIMONY.—The demand is fair, with the market steady at 7¾@8¼c in a jobbing way. New York mail advices quote 7⅜ for Cookson's, 6⅝c for Hallett's and 6¼c for Japanese, from store.

BORAX.—There is a continued free shipment.

The market is quoted as follows:

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	5¼
Concentrated, "	5⅝

QUICKSILVER.—The last steamer for Central America took out 100 flasks for Mexico.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

SHOT.—There is a continued good trade call.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—With the silver market still low, pig tin is weak. The demand is light. Eastern and European advices report inactive markets.

The market is quoted nominally as follows in jobbing lots:

Pig, per lb			14
Plate, I C coke, heavy, per box	$4 10@		—
" " light, "	4 00@		—

POWDER.—The market is practically unchanged.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, "	8¼c

IRON.—The consumption is fair, with the market steady. The East is reported steady at unchanged quotations.

COAL.—The consumption of all kinds is enlarging, but the market is easy.

COKE.—The market is quoted as follows:

Gas Companies'	—	—	— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

Mining Share Market.

SAN FRANCISCO, Sept. 24, 1896.

The market the past week has been dull and heavy, with very little trading. It has acted very much as if a few brokers and outside operators have combined for a small upmove, for there is nothing as yet on the surface to warrant asserting that insiders are in the market. When the latter come in, they make lively moves, and do not, apparently, care whether the general public is short or long; but broker outside operators' move to higher prices is always done after the general public has been largely frozen out of its holdings, and when the work in one or two of the mines is nearing an interesting point which will admit of ore strikes so as to sell on a bulge in prices. The work on the Brunswick lode will, before the middle of next week, reach a point where it is expected the downward continuation of the ore found above will be struck. Of course, this can be enlarged or made small, whichever suits the pool's purpose the best. Then there is another factor which can be brought into play, and doubtless will before the end of October—the Congressional and Senatorial election racket. In years gone by this was used quite successfully to promote higher prices for mining shares before election and lower prices with a drag afterwards. This year it may not be used until after November 3d, for, practically, so far as a deal is concerned, it makes very little, if any, difference who is elected President of the United States. If these premises are correct, then outsiders who have not been frozen out will have an opportunity before the year is over of getting out at an advance on present prices; but when higher prices come, and they hold too long, they are liable to miss it again, for, as stated above, everything points to the market being manipulated by a pool composed of a few brokers and a few outside operators, and these are content with a small deal. The shares of the Bodie mines have had quite a firm tone. They act as if better prices will rule soon.

Official advices from the Comstock mines are practically unchanged and uninteresting, but what is considered reliable information points to more active work at an early day in the Gold Hill and north end groups, probably in the former for election purposes and in the latter to exploit some new ground, which may contain considerable ore, although there are as yet no indications of it. In the Alta group work is only reported in Alta, and, singularly, since the assessment the official letters have been very dry reading. Perhaps this may change after discouraged shareholders sell out. In the Gold Hill group a few tons of ore are raised each week by Overman while doing some exploiting work. Seg. Belcher and Belcher continue to raise some ore, but from what level the letters are silent. The latter company is milling nearly 500 tons of fair-grade ore. The battery assays average a little over $20 a ton. The Crown Point letter indicates they are preparing for more active exploiting work and also the extracting of increased quantities of ore, which ought to favorably affect the market at that end. From Kentuck and Yellow Jacket nothing reliable is obtainable. Confidence is raising a few tons of ore, but nothing is reported in the Challenge's letter. Perhaps, after the pending 10-cent assessment, something of interest may be made public. In Con. Imperial the joint Challenge, Confidence and Con. Imperial crossdrift is being driven ahead. Experienced miners look for quite an improvement in it before long, particularly if the public have sold largely of their holdings. Work in the other crossdrift is being pushed ahead. Both of these crossdrifts are being closely watched by well-informed miners, who look for quite a strike, unless the work is stopped before long. In Alpha they are still working on the 500-foot level. They have not rediscovered the ore found several years ago, which caused the shares to sell considerably over $2 a share; perhaps the latter are not sufficiently concentrated yet. Work in the Bullion long crosscut is continued. This work, if pushed far enough to the west, ought to strike some high-grade ore. In Potosi they are at work on 450-foot level. They have also commenced running west on the "croppings." In Chollar there is no material change in the work. The number of tons raised is steadily decreasing. The work in Hale & Norcross towards Savage attracts attention. It may be that this is all that will come out of it. This company seems to be economically managed and run in the interest of shareholders. The Savage letter is shorter, but contains nothing of much interest. From Gould & Curry and Best & Belcher there is nothing new to report and none looked for soon. In Con. Virginia it is expected that the east crossdrift near the Best & Belcher, from which many looked for great things, will be discontinued soon and another started some distance further north. They will thoroughly exploit the 1000-foot level in the west in the hope of finding ore. The superintendent is following every stringer encountered, with the hope of its leading up to a body of ore. From the 1750-foot level ore continues to be raised each week, but not in sufficient quantity to meet expenses. In Ophir they are exploiting on the 1000-foot and Central tunnel levels. From Mexican, Sierra Nevada and Union the news is about the same as heretofore reported in this department.

The work on the Brunswick lode continues the center of attraction, particularly that on the 400-foot Hale & Norcross shaft level going south. The drift has not been driven as fast as was that on the 300-foot level, and consequently the downward continuation of the ore found on the 300-foot level is not expected to be struck until towards the middle of next week. Mining men are confident that there will be a decided improvement in the quantity and grade. Occidental is extracting and milling low-grade ore. The winze that is being sunk below the 750-foot level is not so favorable. Active work is being done in Hale & Norcross, Savage and Gould & Curry. The Best & Belcher and Con. Virginia shaft is being slowly sunk.

From the Bodie district our advices are about the same as reported last week. Active work is reported by Bulwer, Standard and Bodie, with ore raised and milled each week. In Mono they are still running the drift from the Bodie 400-foot level for the Fortuna lode.

The market opened strong and higher this morning under the lead of Confidence and Challenge. After Call business was slack for a while, but soon revived, with Confidence selling up to $1.55 and Challenge to 55 cents. The remainder of the list strengthened slightly in sympathy. Towards noon there was a bear raid, which weakened prices off under fair trading. At the 2:30 session business was light. Slow progress is being made in the Hale & Norcross-Chollar south drift on the 400-foot level, Brunswick lode, owing to soft ground. The impression prevails with operators that there will be nothing in the market until after election, outside of a few spasmodic up-moves which will be hard for outsiders to catch. Whether this will prove correct, the writer has no way of verifying. It looks very much as if it all depends on what will be found in the south drift on the Hale & Norcross-Chollar 400-foot level, Brunswick lode. Mining men are confident of good results. Yet there are those who have very little faith in the proposition turning out anything very substantial, and, if so, prices for shares on that lode, they think, are too high.

The following illustrates the changes of the week:

ANNUAL MEETINGS.

Company and Location.	Secretary and Office in S. F.	Date.
Anchor Coal and Development Co	E D Farish, 632 Market	Oct 20

THE SANTA ROSA GOLD MINING COMPANY.

Properties located in the Cripple Creek Gold Mining District.

We believe we can give you the largest prospective value for the least money.

Investigate carefully; hesitate before buying other stocks; consider SANTA ROSA and know why you don't want it.

Call, write or telegraph to F. H. PETTINGELL, 10-11 Bank Block, Colorado Springs, Colo.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

Stout St., bet. 16th and 17th Sts.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

THE OVERLAND LIMITED, VIA UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room Sleepers and Dining Cars San Francisco to Chicago daily without change Only one change to New York, dining car service entire distance. Vestibuled composite buffet smoking and library cars between Ogden and Chicago

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St Paul and Chicago without change, leaving San Francisco every Friday

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe D W. HITCHCOCK, General Agent, San Francisco.

THE offices of the Colliery Engineer Company, proprietors of *The Colliery Engineer and Metal Miner*, *Home Study* and the International Correspondence Schools, at Scranton, Pa., were partially destroyed by fire August 30th. Their business, however, was slightly interfered with and the journals were out within a few days of the usual time.

Assessment Notices.

ANCHOR COAL AND DEVELOPMENT COMPANY Location of principal place of business, San Francisco, California; location of works, Kelso, Cowlitz county, Washington.

Notice is hereby given that at a meeting of the Board of Directors held on the 24th day of August, 1896, an assessment (No. 7) of Three Cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 632 Market Street, Room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the twenty-fourth (24th) day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. D. FARISH, Secretary.

Office—No. 632 Market Street, Room 5, San Francisco, California.

GOLDA CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first day of September, 1896, an assessment (No. 79) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fifth (5th) day of October, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 27th day of October, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69 Nevada Block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 2d day of September, 1896, an assessment (No. 24) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of October, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 29th day of October, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first (21) day of September, 1896, an assessment (No. 4) of twenty (20) cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, December 15, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—237 12th street, San Francisco, Cal. Office hours from 4 to 6 o'clock P. M.

ANNUAL MEETING.—The Annual Meeting of the stockholders of the Anchor Coal and Development Company will be held at the office of the Company, No. 632 Market St., room 5, San Francisco, California, on TUESDAY, the 20th day of October, 1896, at 1 o'clock P. M., for the purpose of electing a Board of Directors for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, October 17th, at 12 o'clock M.

E. D. FARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, HAVING received applications to mine by the hydraulic process from Larsen & Harris, in the Larsen mine, near Placerville, El Dorado Co., to deposit tailings in North Canyon; from A. F. Sheehan, in the Blue Eyes Mine, in Duncan Canyon, Placer Co., to deposit tailings in a dry ravine; from the Plymouth Consolidated Gold Mining Co., in the Bell & Dorsey Mine, at Indian Diggings, El Dorado Co., to deposit tailings in Indian Diggings Creek and Scott Creek; from E. A. Wiltsee, in the Gold Run Mine, at Gold Run, Placer Co., to deposit tailings in Canyon Creek; and from H. Spaulding to work in the Craycroft Mine, near Downieville, Sierra Co., to deposit tailings in Hughes' Ravine, gives notice that a meeting will be held at Room 69, Flood Building, San Francisco, Cal., on October 12, 1896, at 1:30 P. M.

SITUATION WANTED by an experienced amalgamator and millman who thoroughly understands his business. References furnished. Address ALEX. H. FORMAN, this office.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco California. Location of works, near La Porte, Plumas county, California.

Notice. There are delinquent upon the following described stock on account of assessment (No. 4) levied on the Thirteenth (13th) day of July, 1896, the several amounts set opposite the names of the respective shareholders as follows

Names.	No. Cert.	No. Shares.	Amt.

FOR SALE.

California Gold Quartz Mines

On and Off of the Mother Lode.

$5,000 to $1,000,000.

—ALSO—

GRAVEL AND COPPER MINES.

E. H. SCHAEFFLE, Murphys, Cal.

FOR SALE.

ONE KNOWLES VERTICAL SINKING PUMP.

Capacity, 12,000 gallons per hour; in perfect order. Will sell at half price. Address

P. ODERMATT, Boiler Works,
58 & 60 Bluxome Street, San Francisco.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

QUICKSILVER!

—FOR SALE BY—

The Eureka Company,

OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

220 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners
By C. W. Moore. With numerous illustrations.....$4 75

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hyaraulic Mining.
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

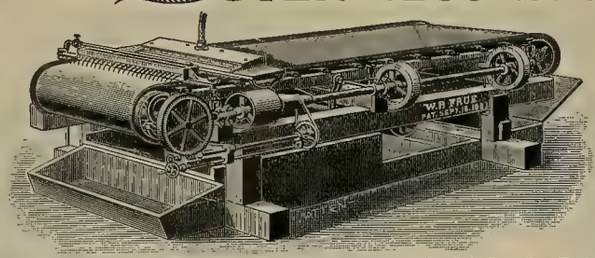
Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

Oil as Fuel in California.

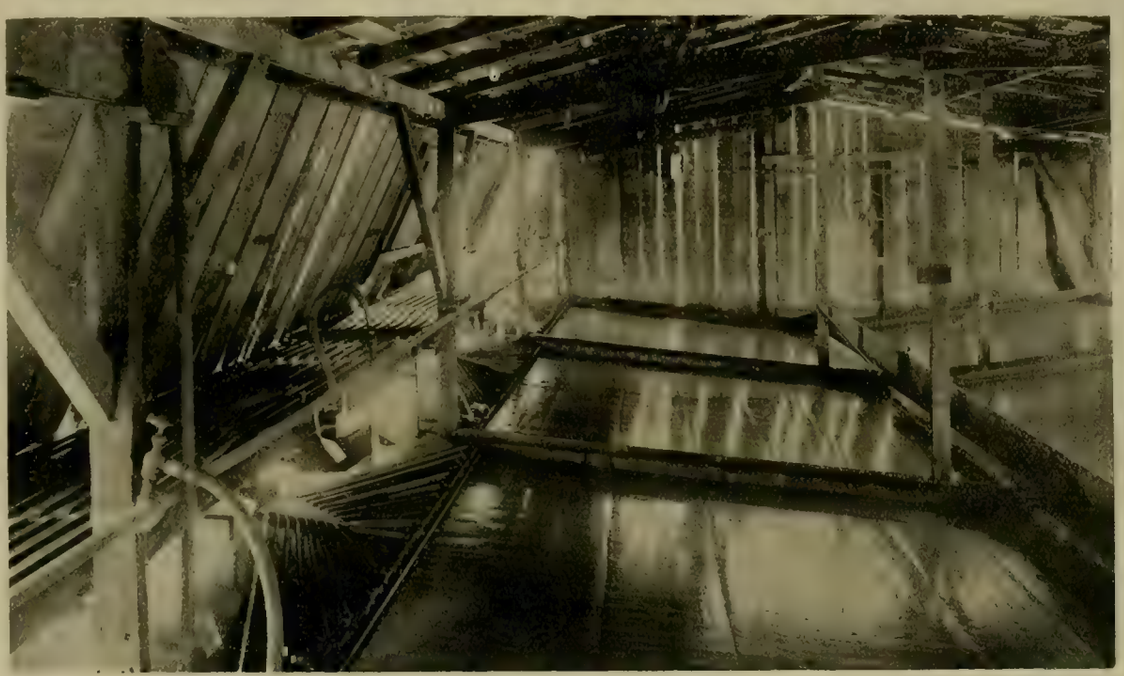
The use of oil as a fuel has been largely increased on the Pacific coast, and especially in California, during the past two years. Of course, the main reason for this is the opening up of the oil wells in the southern part of the State and the marketing of the product at prices that make it cheaper for that purpose than coal. The supply is now large and it promises to be very much increased in the near future. Prospecting wells are being sunk in many parts of the State which promise to add, in time, considerably to the present output.

The fuel question has been a very serious one in parts of California, especially south of Tehachapi, and in the interior, where there is little water power to be obtained, where there is little timber for fuel, and where the freight rates upon coal from delivery points on the coast more than double the cost at those points. Nature seems to have provided, however, in all that part of the State, oil wells in comparatively close proximity to the mines to make up for her niggardliness in other respects.

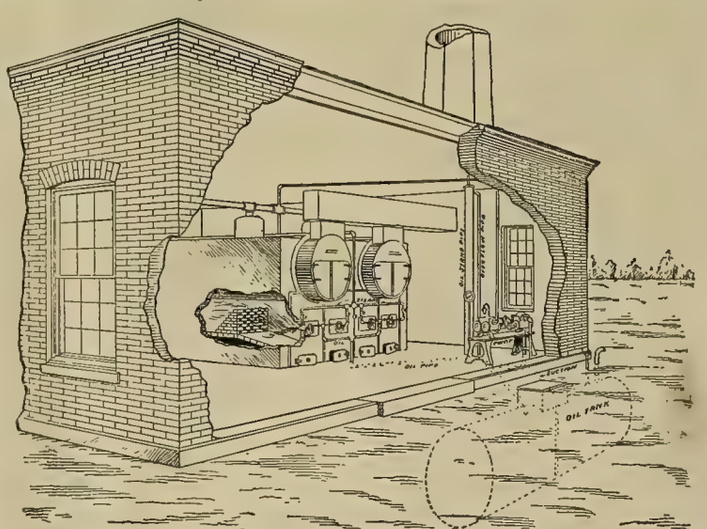
There are many places in southern California where the freight from tide water upon coal by rail is greater per ton than the cost of the coal itself. About three barrels of oil, each of forty-two gallons capacity, is equal for heating purposes to one ton of coal, and it is easy to calculate that the former may be supplied in many different parts of California for a small part of what would be the cost of the latter.

There are over 40,000 oil wells in the United States, with an output of about 200,000 barrels per day. A large proportion of this has been used for fuel, and has been for a number of years. As a result of the introduction of oil for fuel purposes there has been a great deal of activity in the way of inventions for the economical use of the crude oil for generating steam.

We illustrate on this page the Thurman oil burner as applied to boilers. It will be seen that the storage tank is placed underground and outside of the building, and has a supply inlet and a vent pipe. The oil pump is located in the boiler room and pumps the oil from the tank into the stand pipe, which is located near the pump. The oil flows by gravity pressure from this pipe to the burners, where it is atomized by a supply of steam from the boiler. The stand pipe has an overflow pipe back into the tank, which prevents the stand pipe from overflowing, thus keeping a regular oil pressure. The proportion of oil and steam is regulated to any degree at will by the valves located near the burners.



THE GATES CANVAS PLANT AT THE KENNEDY MINE. (*See page 277.*)



THE THURMAN OIL BURNER.

The steam pressure thoroughly atomizes the oil, and the oil atoms intimately commingle with the hot air atoms from the furnace through a pipe, and pass from the mouth of the burner in a highly combustible and vaporous form, thus making pure hydro-carbon gas, which burns like a gas flame with perfect combustion.

Pullman Cars and Investors.

The advantage of railways to mining districts and the effect on investments in those districts by outside capital is well illustrated in California. The average investor does not care to go beyond where he may ride in a Pullman car. It is for this reason that into counties like Sierra, Plumas and Siskiyou, where there are offered splendid inducements for mining investments, very little outside capital goes. It is hardly necessary, in order to show that these counties are exceedingly rich in minerals, to more than point out the fact that without aid of outside capital and simply through the efforts of their own citizens, generally working on very small scales, they rank very high in the list of gold producers of the State. In Sierra county, for instance, there have been some of the largest and richest mines ever operated in California. Yet the opening up of these mines, simply on account of the inaccessibility of the district, has not done much to attract capital to seek others. Easy communication between this city and Sierra county by rail, or Plumas county, or the western part of Siskiyou, would immediately attract the attention of investors.

One is apt to think that the cost of supplies, and consequently the cost of working the mines in these districts, is much higher than in others. This is not true. In the first place, enough agricultural products are raised in the neighborhood of all the mines in these counties to supply them at as low, if not lower, rates as they can be had at San Francisco. Generally speaking, in the neighborhood of the mines in Siskiyou, Sierra, Trinity and Plumas there is an abundance of water for generating power, timber, and, owing to the mountainous character of the country, a majority of the mines may be worked through tunnels and would not require the sinking of expensive shafts. Nothing but the abiding faith of the local people in these districts has kept up the record of these counties as gold producers, for they have had little help from the outside world. It is a notable fact, too, that in these counties may be found the best type of the old style miner—the "honest miner."

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 220 Market Street, Northeast Corner Front, San Francisco
Take the Elevator, No. 12, Front Street.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

Our latest forms go to press on Thursday evening.

J. F. HALLORAN.....General Manager

San Francisco, October 3, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Gates Canvas Plant at the Kennedy Mine; The Thurman Oil Burner, 273. Sectional Views of the Gates Canvas Plant, 277.

EDITORIAL.—Oil as Fuel in California; Pullman Cars and Investors, 273. California Mines and Speculation; Mines on Mexican Grants; Records of Mine Workings; Discovery of a Vein Necessary to Location, 274.

SCIENTIFIC PROGRESS.—The Atom; Specialization in Engineering; Engineering Education; Coal Fields of the World; The Number of United States Patents, 278.

ELECTRICAL PROGRESS.—Utilization of Waste Water; Growth of Electrical Industries in the United States; Power Economically Delivered; A Yacht to Be Operated by Electricity; An Odd Battery; Electric Smelting in Sweden, 278.

MECHANICAL PROGRESS.—The Chicago Tower; The Question of Fenders; Report of Commissioner of Patents; Trans-Mississippi and International Exposition; Gain in Production of Nearly Every Article, 279.

PRACTICAL INFORMATION.—The Naval Academy and Education of Engineers; Bacteria in a Cubic Meter of Air; Large Railroad Mileage in the United States; This Country Produces the Most Paper; Comparison of Teeth, 279.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories. 282-83.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 290.

MISCELLANEOUS.—Concentrates, 275. Gold Mining in California, 276. The Gates Canvas Plant; The Accumulation of Amalgam on Copper Plates; Yield of the Rand, 277. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent Patents; Notices of Recent Patents, 281.

Records of Mine Workings.

The opening up of mines all over California which have been more or less abandoned for a number of years past shows strikingly the necessity for keeping records of all mining operations. It is almost absolutely impossible in this State to obtain any records of the old abandoned mines. Now and then we come across an isolated case where partial information is obtained from miners or superintendents who have worked at these different places.

This was notably the case as to the workings of the old North Star mine in Grass Valley, when during the trial of their late lawsuit it was of the greatest importance to ascertain what developments had been made by the exploration work on the upper levels for the purpose of determining the continuity of the different ore bodies. The present owners and the different experts were unable to furnish any information on the subject, but the fortunate arrival of an old mining superintendent enabled them to gather information that was of the greatest value.

In many of the old abandoned mines of this State are large bodies of ore, which would pay well to work now, but which were passed by in the days when the mines were opened. It is a well known fact that in a great many instances in days gone by it was not possible, with the high price of wages and supplies and cruder methods, to work great bodies of comparatively low-grade quartz, which were opened by shafts and levels, and, therefore, many of the owners of these properties were compelled to drift through such deposits for high-grade rock, which would enable them to work the mines successfully. Had records been kept of all the old mines, many of these ore bodies would now be taken out and worked to a profit.

In cases of accidents in mines that have been worked many years it is often of great importance to know of the old workings in order to find the nearest places of approach to reach the different sections.

It would be of enormous value to the miners of this State if the records of all mines were kept. The State itself should require of every mine owner that surveys of all underground workings should be made and filed with the proper authorities. These would not only serve as records of workings, but would give information of inestimable value to those opening up new mines, in showing formations, in showing what the old operators had gone through, and enable those opening the new mines to know what to expect. As it is, they grope in the dark and know as little in many cases as if there had never been a mine opened in the district. It is well known that what occurs in one mine in any district is liable to occur in others.

Mines on Mexican Grants.

In a Virginia City paper there appeared last week an editorial in which it was stated that, with few exceptions, the land grants from Mexico conveyed no right to mineral beneath the surface and that, although the owner may not claim the mineral beneath the surface, it does not follow that the mineral area of such a grant is subject to location under the United States mining laws. "The surface does not belong to the United States. It belongs to the grantee or owner of the grant. He alone has a right to enter upon the ground, and any one else entering for the sake of locating a mineral land claim or any other purpose is a mere trespasser unless permission be given by the grant owner. Even the grant owner himself cannot locate the ground as a mineral claim, for the mining laws apply only to the United States. A mining claim cannot be located upon private property. From this it appears that there is no way by which, under the laws of the United States, title can be acquired to the mineral contained within the limits of the ordinary land grant. The owner of the grant cannot extract it, and he cannot give that right to any one else."

Upon this subject two California decisions bear. In the case of Williams vs. S. C. M. Assn. (66 Cal., 193), it appears that the defendant derived title from the Mexican or Spanish Government to several tracts of land since "commonly known as the Guadalupe mine," and the Supreme Court held that the right of the defendant to extract ore therefrom in no way depended upon a claim to the possession made in recognition of and in conformity to local rules adopted by miners of a mining district, or in accordance with the usages or customs of a locality. And the Court cited the case of the Fremont grant, saying, in that connection, that, "although it was not a mining claim, many mines have been opened within its boundaries, and the owners of the grant may claim such mines as their own." The question in this case before the Court, as in Morse vs. De Ardo (107 Cal., 622), was whether land held under a grant or an "agricultural patent" was subject to a lien for the wages of laborers employed in working a mine upon it; and in both cases the Court held that such land was not a "mining claim" within the meaning of the Mechanics' Lien Law.

As a general proposition as shown by these two cases—and it is a doctrine of common law—a man who holds title to the surface owns up to the sky and down to the center of the earth. One, therefore, owning certain territory would naturally have the right to devote it to any purpose that he sees fit—either raise crops thereon or dig minerals therefrom, if any should exist therein. If there exists any restriction in any grant, as mentioned in the editorial, the provisions of the particular grant would have to be looked into; but in no event can any person initiate a valid title to a mining claim upon ground held by another, no matter what that title may consist of.

Discovery of a Vein Necessary to Location.

In a case in a Colorado court lately a party asked the judge to instruct the jury that, to constitute a valid location of a lode mining claim, it was not necessary that a vein or lode of mineral rock in place should be discovered within the limits of the claim attempted to be located, but that a valid location might be made, if in other respects complying with the law, if the discovery of a vein is made by the locator upon an adjoining location owned by him and others, which vein, if maintaining the same strike as at the point of discovery, would pass into the claim attempted to be located, although, as a matter of fact, the vein is not traced, or shown to have passed, into the latter location.

In denying the motion the court said:

This contention is based upon a supposed analogy existing between annual assessment work, which may, in certain circumstances, be done outside the claim, and a valid discovery, which is a condition precedent to a valid location in the first instance. But this contention is contrary to all previous announcements upon this subject, and finds no support in the Federal or State statutes, and, in the absence of a decision by the Supreme Court of the United States to that effect, we decline to establish such a doctrine. The discovery must be within the limits of the claim located, and upon unappropriated territory.

The matter of what constitutes a valid location has engaged much of the attention of the courts. A few of the decisions upon the point of what constitutes a discovery sufficient to support a valid location have been handed to us by Mr. A. H. Ricketts of this city. They are as follows:

In United States vs. Iron S. M. Co. (128 U. S., 673), the Supreme Court of the United States said:

It is the policy of the Government to favor the development of gold and silver and other metals, and every facility is afforded for that purpose; but it exacts a faithful compliance with the conditions required. There must be a discovery of the mineral, and a sufficient exploration of the ground to show this fact beyond question. The form, also, in which the mineral appears, whether in placers or in veins, lodes or ledges, must be disclosed so far as ascertained.

Again, in King vs. Amy & S. M. Co., (152 U. S., 222), the same court said that a location can only rest upon an actual discovery of the vein or lode. In North Noonday M. Co. v. Orient M. Co., (Fed. Rep., 522), Judge Sawyer said:

It is only necessary to discover a genuine mineral vein or lode, whether small or large, rich or poor, at the point of discovery within the limits of the claim located, to entitle the miner to make a valid location including the vein or lode.

In Van Zandt vs. Argentine M. Co., 8 Fed. Rep., 725, it is said that to constitute a body of ore a vein or lode, it must exist in mass and position, not in a broken and fragmentary condition, intermingled with the slide and debris on the surface of the mountain.

Again, in Bank vs. Justice M. Co., 58 Fed. Rep., 106: When the locator finds rock in place, containing mineral, he has made a discovery, within the meaning of the statute, whether the rock or earth is rich or poor, whether it assays high or low.

In Iron S. M. Co. vs. Cheesman, 3 Fed. Rep., 297. A vein or lode is in place within the meaning of the statute if the ore body is continuous, and so far as the ore body is continuous it must have been deposited in that form, or removed bodily, and with its enclosing rocks to the place in which it may be found.

In Crossman vs. Pendery, 8 Fed. Rep., 693: Priority in discovery gives better title to mineral in place than priority of location and continuous possession.

California Mines and Speculation.

Since the beginning of the present so-called revival in mining there has been devoted less attention to California than to any other important mining field in the world by the journals published in Europe and in the East in the interest of mining investors. There are two principal reasons for this: One is the fact that stock-jobbing methods have almost entirely ceased in this State; and the other is that the nature of the mines gives less opportunity for making deals in shares in California mines on stock exchanges. They are nearly all gold mines, and unlike silver and other mines, are not subject to sudden fluctuations in value owing to the irregularities of the ore bodies.

Californians learned a valuable but expensive lesson from the Comstock stock gambling of the seventies and early eighties. To such an extent has this lesson been taken to heart that the general public will not buy shares in any mine. This does not show, by any means, a want of confidence in mining, for people of all classes are more interested in that industry than ever before, but always in a cautious, business-like way. Those who invest do so only upon personal knowledge of the mines themselves or upon the recommendation of people they know and can trust. It is all done just as they would invest in real estate or go into any commercial business enterprise.

To this want of a speculative spirit is due in large part the failure of papers like the *Financial News* of London to notice California. Its clients are stock buyers who learn of the mines through the public prints, and not through direct investigation, and who purchase rather for speculation than investment.

The mining people of California have not acquired again the habit of stock-jobbing, such as was in vogue during the palmy days of the Comstock, and so do not give much encouragement to outside speculators to do business of that nature in this field. While this has done much to prevent California from receiving the attention of the mining speculative world, in the end it will be a good thing for us, for our mines have not been boomed by any factitious methods.

Within the past few months signs have been shown that we are to be large gainers by this. While we have not attracted the attention of the syndicates and companies of the Old World who are looking for mines for speculative and stock-jobbing purposes, California is now engaging the attention of the largest conservative companies which purchase mines for the sake of investment. The Exploration Company, the largest concern of the kind in the world,

has made two or three investments, has had a number of properties examined, and within a few days a well-known mining engineer has arrived here to remain in this State in charge of their interests. The mere fact of his coming is evidence that the Exploration Company intends to extend rather than curtail its interests here.

Capitalists interested in the Chartered Company are having their attention directed to the Pacific coast by their consulting engineer in London. The consulting engineers of both these companies are Californians. Most of the experts employed by them are Californians, whether the work is here, in Africa or in any other part of the world.

When a few years ago California was called upon to send many of her best mining engineers to other fields, it was predicted then that we would become short of home talent for developing our own mines, and, in a measure, this would be a loss to us; but, really, on the other hand, it turns out to have been a good thing.

Many of these men have taken leading places in the mining world. They have been placed in positions where they can compare the relative merits of the leading gold fields of the world, and the fact that many of them are drifting back here goes to show their faith in our mines. More than that, they return with the confidence of their employers abroad and with an acquaintance and connection that will enable them to do much toward interesting capital in California.

Concentrates.

REPORTS are made of gold discoveries in Newfoundland.

A STRIKE of a good body of ore in the Cadmus mine at Nevada City has been reported.

THE late storms in the Sierra Nevadas have caused predictions of an early and severe winter.

THE Golden Drip, in British Columbia, has been bonded by J. D. Warner of New York for $50,000.

AT Lead, South Dakota, last week over 200 miners were laid off with malignant typhoid fever.

A NEW hoist is to be put up in the Rising Star gravel drift mine at Central Hill, Calaveras county.

AT the Tyro mine, in Mariposa county, it is proposed to increase the number of stamps from 10 to 20.

SHAW & Co., owners of the Golden Fissure mine in Butte county, are preparing to build a quartz mill.

THE Homestake Mining Company of the Black Hills has declared dividends to date amounting to $5,993,750.

IT is claimed that the output of bullion from Gilpin county, Colorado, will be larger this year than ever before.

A CHINESE hydraulic claim on Slough creek, in the Cariboo country, has been purchased by a Victoria company for $25,000.

THE Bunker Hill Gold Mining Company proposes to erect a 10-stamp mill on their property near Coulterville, Mariposa county.

SOME people are investigating the black sand of the beach below Crescent City with a view to working it with new appliances.

THE owners of the Selleck mine at Haywards, Mariposa county, are arranging for the purchase of new machinery in this city.

THE Citizens' Bank of Grass Valley last week bid in the Pittsburg mine, hoisting works and machinery for $3805.29 at sheriff's sale.

ANGUS MACKINTOSH, owner of the Hayseed and Triumph mines at Whitlocks, Mariposa county, is purchasing machinery preparatory to starting up.

THE principal value of the early rains in the Sierras has been in extinguishing fires and so saving much timber that is or will in time become valuable.

THE De Lamar Company has promised to erect a large, substantial schoolhouse in De Lamar, Nevada, providing the citizens select and prepare the site.

A STRIKE of rich ore in the big tunnel at Austin, Nevada, encourages the people of that town with the idea that there will be a return of prosperity soon.

BETWEEN the mines of southern Oregon and those about Baker City, in northeastern Oregon, that State gives promise of becoming a large producer of gold.

THE recent rains have cleared the air of smoke in British Columbia and the hills about Trail are again full of prospectors who were driven out by the forest fires.

AT the Horsefly mine, in the Cariboo country, the presence of cement has made it impossible to work much ground by hydraulicking, and arrangements are being made to drift.

A NUMBER of dredging machines have been built for working the auriferous gravels of the Quesnelle, in the Cariboo country, but, it is said, none have been worked successfully so far.

THE Great Falls Mining Company has completed the construction of a dredger for working the gravel of the bed of the Missouri river in Montana between Townsend and Canyon Ferry.

IT is again reported that the War Eagle, Iron Mask, Virginia and Poorman mines, in the Trail Creek country, in British Columbia, have been purchased by an English syndicate for $1,000,000.

THERE are about 200 people now on the upper part of the North Yuba, working the bed of the stream by turning the watercourse with brush and stone walls. A majority of them are Chinamen.

F. AUG. HEINZ of Butte, Montana, has returned from London, where he went to enlist English capital in railway, townsite and smelter properties in the Trail Creek district in British Columbia, but is understood to have been unsuccessful.

A DISCOVERY of nickel near Colville, Washington, has been reported. The ledge in which the metal exists is about four feet in width. Nickel is known to abound in many places north of that city, but this is the first discovery that promises to be valuable chiefly for that metal, says the *Spokesman-Review*.

THE copper veins in the Escalante mountains, in Colorado, are attracting attention. It is claimed that the Indians formerly resorted to this region for the purpose of getting copper for their implements, and, even with their crude methods of reduction, were successful in getting out the metal, which was hammered into shape.

WYOMING is giving promise of becoming a rich mineral-producing State. Reports have come of late of the opening up of many placers in different parts of the State of the discovery of asbestos mines, and last of the discovery of very rich quartz on the South Fork of the Grand Encampment, northeast of Rawlins. There are reported to be free gold and rich veins of milky white color.

A MINING MAN, who has returned from Sonora, Mexico, says that the mines of that State generally produce an aggregate of 650 tons a month, which output would, however, be multiplied many times if there were better facilities for transportation. But when ores are packed and hauled from 30 to 150 miles before reaching a railroad, they must be exceedingly rich to be moved under existing conditions.

THERE is considerable activity in placer mining all along the Columbia river, from Northport, as far down as Marcus, in Washington. At Six Mile bar a 40-horse power pumping plant is being put in by Spokane parties for the purpose of raising sufficient water from the Columbia river to mine a tract of ground. These bars were worked profitably in the early 60's, and in later years the Chinamen have found it profitable working them.

THE *Kootenaian* of Kaslo, B. C., says: "A special dispatch to the Toronto *Star* from Rossland states that a body of ore 30 feet in width had been struck that day in the Mayflower, upon which smelter returns put a value of $56 per ton. This is probably all right, but in this country it requires a little more than one day to get smelter returns. The same dispatch says the ore is chalcopyrite, and that the galena and quartz are gangue. Great country!"

OWING to the growing interest in British Columbia mines the Toronto Stock Exchange has decided to receive applications for the listing of mining stocks. The conditions require that in each case evidence must be furnished as to the proper incorporation of the company, good title to mine or principal mines owned, that at least $25,000 has been expended in operating, that the stock issued as fully paid up is non-assessable and free from subscription liability.

THERE is considerable suffering from want of necessities and cold weather among the boomers who are camped on the borders of the Blackfoot reservation in Montana waiting for its opening to settlement. The number has dwindled down to about 100, and it will be nearly six months before the opening will take place. But there are reported rich mineral deposits within the forbidden land, and doubtless the hope that springs eternal in a miner's breast will keep some of them there all winter.

THE Denver *Republican* says that T. W. Goad, who has been manager of the Gold and Silver Extraction Company of America in Colorado, has resigned and gone to London, where, in connection with a number of capitalists, he has established a bureau for the promotion of mining enterprises in this country. After getting the London office in operation and putting the business in proper shape, Mr. Goad will return to the United States and establish an office in Denver and another in San Francisco.

A NEBRASKA man was in Denver, Colorado, last week to look into the cyanide process for the purpose of working an auriferous deposit, which he describes as follows: "The material carrying the gold is clearly a sedimentary deposit lying in a stratum for 2 to 7 feet thick. We find it sometimes 20 feet thick. Generally it is found a few feet below the surface, but it frequently rises to the surface. The locality is on the Elkhorn, 50 miles north of Lincoln and about 50 miles east of the eastern line of Colorado. It has been traced for a distance of 100 miles, and one of the objects of our company is to discover the extent of the deposit."

THE United States Geological Survey has issued a pamphlet on the stone industry of the United States in 1895, by William C. Day. The total value of different kinds of stone produced was $34,688,816, against $37,055,030 in 1894. California stands fourteenth in the list of States as to the amount produced, with $715,450. In 1890 California produced granite to the value of $1,329,018, while the value of the 1895 product was only $348,806. The value of the marble product in this State in 1890 was $87,030, in 1892 $115,000 and in 1895 $22,000. Of the sandstone product the value in 1890 was $170,000 and in 1895 $11,933. However, similar decrease is noted in other States and is all credited to the late financial depressions.

THE Redding, Shasta county, *Searchlight* says: "Experimenting is at an end with the Mountain Mines, Limited. The new water-jacket smelter recently erected has been running for several weeks, giving satisfaction. Two hundred tons of ore are being handled each day. This means a yield of from $4000 to $8000 per day. Two shifts of twelve hours each are being run. The old smelter is expected to start up this week. Two more water-jacket smelters will be erected shortly. About 250 men are employed at Keswick, besides over 100 men at the mine. Until now the company has been operating with little or no returns, and it means much to the miners and this county in general that the Mountain Mines, Limited, are at last on a paying and permanent basis."

IN a late number we spoke of the delays in the issuance of the U. S. Geological Survey reports upon mining districts. Now comes the Salt Lake *Herald* and says that it is probable that a resurvey of the Mercur district will be ordered, and continues: "Certainly the report which followed Mr. Spurr's examination—owing to the interval between the date of its issue and the collection of his data—is very unsatisfactory. It was a "back number," in plain words, before it began to circulate. Before its appearance so many changes had developed in the quality of the ores as to render it of little benefit except as a treatise upon their occurrence. According to those interested it dealt too extensively with the past and not enough with the present."

THE Spokane *Chronicle* says: "It is stated that Supt. Hall of the Le Roi has begun his administration by raising the wages of the miners. Rossland has always been what is known as a 'cheap camp,' the scale of wages paid there being lower than in most mining camps, and especially new ones. Mr. Hall has therefore taken the first steps toward raising it to the level of other gold camps. Miners are now paid $3.50 for eight-hour shifts and carmen and shovelers $3. This is an increase of 50 cents a shift all around."

THE British Columbia *Mining Journal* says: "The Wonderful, a mile and a half from Sandon, is the most peculiar silver property in the West. It is worked like a large placer claim. The owners have turned little streams down the side of the mountain and from the surface wash in a gorge 400 feet long, 80 feet wide and 40 feet deep, it is said, there has been gathered $60,000 high-grade, clean shipping ore. Thirty men are working on this claim, and they are taking out more ore than if they were working on a vein. The ore is gathered off the wash, stacked in piles and afterwards carried in sacks to the ore house. It is almost like picking up nuggets from a gold placer claim. The Ruth, also above Sandon, is a fine property and is working a large force of men."

THE Canadian Government is evincing a greater interest in assisting the development of the mines of the West than was ever done in this country by the Federal Government. The Alberta *Tribune* says: "The development of the West means expansion of Eastern manufacturing industries to supply the increased market; the employment of a much larger number of artisans; the increase in value of Eastern real estate in the vicinity of the manufacturing centers; and the general increase of prosperity of the nation. If the disabilities under which the West labors, and which the Government can to a great extent control, were removed, and an intelligent, well-thought-out policy of development pursued, we would see every Province of the Dominion benefiting thereby."

ACCORDING to the Denver *Republican*, the lessee is again in evidence in Cripple Creek. "There was a prejudice against him when the year opened by the companies who received back exhausted mines from him, and there was some talk about the day of the lessee being ended. Just then it looked as if every inch of idle ground in the district was to be bought up by outsiders and that there would be millions of money available for development; but that soon passed. The country showed it had no millions to spare, and the companies with money to operate were few. It began to be seen that the idle ground was to remain idle unless the lessee was invited to go prospecting. Next year those mines he is working now will go back to the owners and he will be forced out to hunt more ground and make it valuable for other companies; but the lessee finds the system a paying one for himself, and, collectively, he is the best friend Cripple Creek ever had."

AN English syndicate has taken up an "ore atomic reduction process," which is described by them as follows: Everyone concerned in mines is aware that one of the greatest difficulties miners have to deal with is the crushing of quartz, especially those of refractory ores, which, owing to the presence of iron pyrites, render the metal of excessive hardness. To deal with this, enormous expense has to be incurred. This marvellous invention will do away with all the crushing and stamping and pulverizing, and within an hour enable a miner to reduce the hardest quartz to the condition of sand, and even of fine flour, without slime, and perfectly free from the various deleterious substances which are the enemies of the gold miner all the world over. Wherever tried, no matter how hard the quartz, it yielded to the process in times varying from twenty minutes to one hour. The extraordinary thing is that experience has shown that if, under the invention, the ore fails to break into particles within an hour, therein lies proof positive that it contains no metal.

THE Exploration Company of London, which has the backing of the Rothschilds and at the head of which is Hamilton Smith, a Californian, is arranging for the purchase of all the stock of the Anaconda properties in Montana and the Homestake mines in the Black Hills. More than a year ago the Exploration Company purchased one-quarter of the stock of the Anaconda Copper Mining Company from the Hearst estate for $7 500,000. Following this sale the same purchasers obtained an option upon a second quarter of the stock—250,000 shares—at $9,000,000. This option was closed and the transfer made a few months ago. Immediately after this sale and transfer was completed, the company sent its expert to this country, and, after he had examined the property, he obtained from J. B. Haggin and Marcus Daly a third option on 500,000 shares of stock at the same price that was paid for the second parcel of 250,000 shares, or $18,000,000. Advices from London say the expert has started for New York empowered to complete the purchase and transfer of this stock, which will make the Exploration Company, or the Rothschilds, sole owners of the Anaconda Copper Mining Company at a cost of $34,500,000.

T. A. RICKARD, State Geologist of Colorado, says: "It is a noteworthy instance of the vicissitudes of mining that of the several properties which in 1889 yielded more than three-quarters of the output, not one is to-day producing, although in several instances a large yield is now coming from mines adjacent to them and previously idle. Seven years is longer than the productive period of an average mine. One can extend the field of inquiry over the whole State, only to confirm the deduction just suggested. Of the properties which yielded over $500,000 in 1889, more than half are to-day producing less than $50,000; others have taken their places. Nor is this characteristic of Colorado only; on the contrary, it is particularly worthy of note in discussing the history of a State whose ore deposits are notably more persistent than those of most mining regions. It is due to the hurry to realize upon the wealth uncovered by the pick of the miner; it is aided by the rapidity of exploitation rendered possible by a magnificently elaborate industrial machinery; it is also traceable largely to the impudence of mine managers, who are forgetful of the necessity of doing an amount of exploratory work which shall keep pace with the removal of ore."

Gold Mining in California.

NUMBER II.

By AUG. J. BOWIE, Mining Engineer.

Our Miners.—It is proper before passing from our mines to other subjects, that a fitting tribute should be paid to our miners of California and Nevada. The average intelligence of our foremen and workmen stands unequalled. They have been the pioneers of the country and the advance guard of civilization. They have braved the dangers of the development of a new country, and where necessity demanded they have not hesitated to lay down their lives in pursuit of their vocation. They have opened up mines to a depth of about 2000 feet to 3200 feet, under circumstances unparalleled in the annals of mining and on a scale unprecedented in history, showing a degree of skill and ability in the handling of the output which has commanded the admiration of the world.

California Gold Quartz Mill.—The ore being extracted from the mine and delivered on the dump, is from there taken to the mills. Every miner is thoroughly familiar with the California gold quartz mill, and when it is contrasted with the antiquated European stamp works, its superiority in every respect is at once patent. Time will not permit us to enter into the details of the construction of a quartz mill, as it would occupy too much space and would partake largely of mechanical details uninteresting to any one but a mechanical engineer. A few general remarks may, however, be of value.

The mills are provided with rock breakers in accordance with the requirements, and are so arranged that when the ore is discharged from the cars the finer portions pass through the grizzlies to the ore bins, which automatically discharge into self-feeders behind the batteries, while the coarser particles fall by gravity to the rock breakers, through which they in turn pass to the ore bins. The weight of the stamps, including tappet, boss and shoe which we are now using in the large mills, will average about 860 pounds each, and running with double cams they are speeded to drop 85 times per minute. The length of the drop is from 9½ to 7 inches, as the case may be. The cams are not simply cams cut in half circles terminating in a tangent like that occasionally seen in the mountain regions of the West, but are laid out on the involute of a circle, the radius being the distance from the center of the cam shaft to the center of the stem, allowance being made for the nub of the cam and clearance of the tappet.

The stamps drop on dies set in the bottom of iron mortars fitted with side and end linings. The mortars are set on blocks and bolted to them, the tops being covered with blankets. They are arranged in batteries of five and fall from the center outwards one after the other (3–5–2–4–1), this insuring complete circulation of the pulp. Mortars properly constructed for gold milling should be fitted with soft copper amalgamated plates in the back inside and on the front inside, and have a low discharge over the top of the dies. In front of each battery there should be a table of equal width, with amalgamated soft copper or silver plates set in lengths of 8 or 10 feet, to receive the pulp discharged through the screen which fits the front of the mortar. The screens used are either punched or cut slot, or wire screens, the number or mesh depending on the fineness to which the ore or material is to be crushed. The other accessories, such as riffles, vanners or blankets, it is unnecessary to describe here.

Power.—The stamps are driven by steam, water or electric power. Direct battery amalgamation in gold milling is what is known as wet crushing, water being continually discharged through the battery to assist in removing the pulp as it is crushed. The quantity of water requisite for each battery of five stamps with a No. 6 punched screen, when from 2½ to 3¼ tons per stamp are worked during twenty-four hours, will vary from 1¼ to 1½ inches, the inch of water being figured at 1½ cubic feet discharged per minute. The power required to drive a five-stamp battery may be placed at 1½ H. P. per stamp, rock-breaker capacity and vanners requiring an additional amount pro rata with the size of the rock breaker and number of vanners employed. As a general proposition, it will require two Frue vanners to handle the pulp from each battery of five stamps, and one 9 in. x 15 in. Blake rock crusher would suffice under ordinary circumstances for forty stamps. No study of the theory of gold mill amalgamation will avail in its practice. It is by actual experience alone that a thorough knowledge of it can be acquired.

Starting Up.—Where mills are to be started up it is, of course, supposed that the quartz has been tested and that some idea has been formed of its contents in free gold. In many cases this may not have been done, though the old miner would never venture to build a mill unless he had thoroughly assured himself by his own hand tests of the value of the ore. Any miner who will take a fair average sample of the quartz, crush it thoroughly, and amalgamate a small amount of given quantity, can approximately determine the amount of free gold which he may expect to get by battery amalgamation. Experience in amalgamating gold in a battery teaches the amalgamator that the quantity of quicksilver required must be proportioned to the amount of gold contained in the quartz. In other words, there is a proportion existing between the gold and quicksilver forming amalgam, and the finer the particles of gold the greater the amount of mercury necessary. The amalgamated gold is deposited on the back and front plates in the mortar, the detached pieces packing between the dies, or discharged through the screens over the lip of the mortar and caught by the amalgamated copper plates on the table in front of it. No matter how accurate the knowledge may be of the metallic contents of the quartz, the time when the quicksilver is to be fed into the battery and the quantity to be used are regulated only by the actual showing of the amalgam on the table plates.

In starting up the battery, the plates being clean and freshened with a little quicksilver, the stamps are allowed to run a half hour or more on the quartz to securely pack the dies and the inside of the mortar without the addition of mercury. When the dies and mortar are packed quicksilver in very limited quantities is fed in at the back of the mortar. The amalgamator now carefully watches the condition of the table plates. These plates, kept in proper condition at all times, indicate the state of the amalgamation and the requirements in ordinary milling on average rock.

Quicksilver.—A small amount of quicksilver is added every half hour as long as the amalgam formed on the table remains sufficiently plastic. Should the quicksilver be observed to form in drops or globules and not to be depositing regularly in the first 2 or 3 feet in the form of amalgam of the consistency of putty, it indicates that further addition is unnecessary. On the other hand, the tables show that if the amalgam on them has become too hard, and does not yield readily to the touch, it is proof positive that the metal is absorbing the quicksilver and more is necessary. The plate should, at all times, hold amalgam of a proper consistency of hardness, and the surface of the amalgam should be repeatedly "broomed up" and kept fresh and bright.

It is extremely difficult to describe all the features which present themselves in gold mill amalgamation. The tables should be cleaned up once or twice during twenty-four hours, the excess of amalgam taken off and the plates kept bright and coated with quicksilver. The amalgam (escaping from the battery) is principally confined to the upper part of the table, any excess being scraped off with pieces of hard rubber and put to one side. An excessive use of quicksilver will run the greater part of the amalgam into the sluices.

When the mill shuts down at the end of a run, and the plates are thoroughly cleaned, the table plates should be well scoured with sand or with a brick, leaving them soft and in a broomy condition, which is best adapted for receiving the quicksilver and catching the amalgam. Under no circumstances should acids or cyanide of potash be used, as they only burn and harden the copper.

Approximating the Yield.—It is apparent from what has been said that a competent amalgamator can approximate from day to day what his quartz is running, so that a very close estimate of a month's yield may be made from the record which is always kept of the exact amount of quicksilver used daily in each battery. There are, of course, exceptions to this rule which may deceive the amalgamator. Sulphurets in large quantities will absorb an excess of quicksilver, and even after floating the amalgam give an excess of weight which cannot be ascertained until after the amalgam has been retorted.

The First Run.—The first run of a mill is very apt to be disappointing, a result generally due to an exaggerated estimate of the value of the quartz, or the quantity of base metals, babbit, lead, etc., which invariably find their way into the batteries of new mills, the bars produced being large, but of low fineness. A case due to other causes was mentioned a short time ago in the reports from Johannesburg of the workings of the deep levels on the Rand. The report stated that some 20,000 or 30,000 tons worked from the 2000-foot level of their principal mine yielded only 3 or 4 dwts. per ton. The stockholders, discouraged by the returns, looked to their manager for an explanation of this poor yield, and the answer reported given was: "That in a new mill the plates and quicksilver had to be charged, and that the plates had absorbed some $75,000 of the gold." The Johannesburg *Critic* quaintly remarked that "the manager had better smelt the plates." Carelessness or ignorance on the part of the amalgamator is a very serious proposition. His position is a confidential and most responsible one.

Mill Tests.—It is not unfrequently the case that parties purchasing mines are recommended to have a mill test of the ore made at the mine. There can be no objection to such tests, if fairly made; but, under the conditions in mining regions where these trials are conducted, nothing can be more dangerous or offer greater facilities for fraud. Any person sent to examine a mine should be qualified to give a reliable opinion on the value of such property, without being dependent on the results of such mill tests.

We have now described at length the milling of gold quartz. It only remains to be added that in all large works of 80 or 120 stamps the mills are cleaned up but once a month. They shut down in the morning at 6 o'clock, and by 6 o'clock in the evening the entire mill has been overhauled, put in perfect condition and started anew for the succeeding month's work.

Treatment of Amalgam.—The treatment of the amalgam which has been collected from the battery plates inside the mortar, and from the tables, is exceedingly simple. The clean amalgam is floated in quicksilver, all foreign substances detached, strained and pressed into balls as large as can be conveniently squeezed by hand. The other portions, containing considerable sand or foreign substances, are put into a small gold clean-up pan, to which quicksilver is added. The amalgam, with quicksilver, is subsequently tapped off, strained, cleaned and retorted, together with the other amalgam.

The retorted amalgam is melted, run into bars, chipped, assayed and stamped. The bars are then ready for delivery.

The result of experience in milling low-grade quartz has demonstrated that economy requires the largest possible quantity to be treated at the smallest cost in the shortest possible time, with due reference to the percentage of yield.

To accomplish this end, in the first place, the mill should be so constructed as to avoid all possible handling of the quartz from the time when it enters the mill to its discharge.

Secondly, large rock-breaker capacity is essential.

Thirdly, the square-bottomed die is the most desirable.

Fourthly, there is no economy in using shoes or dies after their surfaces have been irregularly worn to any great extent.

Fifthly, false bottoms for dies are not economical.

There is a peculiarity about men operating mines and mills which should here be noted. Some superintendents figure that great ability is shown by the largest production of quartz at the smallest cost, hence the distribution of accounts frequently shows very small cost for the tonnage produced, while the cost for exploratory work and construction is made to appear very large; others endeavor to show that the costs of milling are insignificant and that an exceedingly low-grade quartz can be economically worked. This is not difficult to show on paper, because it is easily accomplished by diminishing the value of the ore per ton and increasing the tonnage worked.

From experience in the Black Hills, Dakota, where some of the largest mills in the world have been built, and in California, it is estimated that from 2½ to possibly 4 tons per stamp can be crushed in twenty-four hours. This depends, of course, on the character of the material and the size of screens through which the pulp is passed, the stamps weighing from 800 to 900 pounds and falling from 85 to 90 drops per minute.

The cost of milling varies from 40 cents to $1.15, and the difference between milling by steam and milling by water is 80 cents (steam) to 45 cents (water), the basis of this estimate being on labor at $3.50 per diem and wood at $4.25 to $4.50 per cord.

The stamp mills to-day running in South Africa and other parts of the world have all been copied from the designs and work of the California mechanic, to whom the world is indebted for the great improvements in milling machinery. One frequently reads of the marked advance which has been made in the milling of gold quartz during the last fifteen or sixteen years, but I fail to find any improvement made on what was already in practice in California and Dakota sixteen or seventeen years ago. With the exception of vanners, which have been largely perfected during this period, permitting the economical concentration, there has been nothing new of special note. Plattner's chlorination process has been known and used for forty years and has been most economically and successfully handled in this State.

Silver-plated battery and table plates are more generally used now than formerly. They were in use twenty-five years ago, but too expensive for general service.

The costs of mining and milling in foreign lands are held up as models of economical handling of works. As a matter of fact, none of them stand the light of investigation and could bear fair comparison with the work done in California or Dakota. On the contrary, take the price of labor and supplies paid in this country and abroad, the character of the material mined, and it will show that California is still foremost in the handling and working of gold ores.

The cost of mining and milling per ton, as we understand it in California, after the plant and mine has been paid for, is determined by dividing the total tonnage mined and milled into the total costs, and the yield per ton is the tonnage milled divided into the gross bullion product—the profit per ton being the difference between the cost and yield per ton.

The salary and office accounts are chargeable alike to mine and mill accounts, as are likewise all legal expenses. All disbursements of whatever nature made for account of the mill or mine after the property has once been paid for are chargeable pro rata per ton to their representative accounts of mining and milling. The value of a mining plant after the mine has been worked out is practically *nil*.

(*To be Continued.*)

The Gates Canvas Plant.

Written for the MINING AND SCIENTIFIC PRESS by W. S. HUTCHINSON.

At some of the California gold quartz mills it has been found that a considerable amount of value escapes with the tailings in the form of finely divided rich sulphurets, which are too fine to settle on the belts of the concentrators. The tailings of the Kennedy mill, near Jackson, Amador county, California, contain about $1 per ton in gold, and a portion of this value is in the form just mentioned. For several years Mr. G. G. Gates has treated these tailings and recovered the fine sulphurets with remarkable success upon his canvas plant. His methods are adapted to the treatment of any mill tails when their value is contained in the form of fine, rich, heavy mineral which escapes other methods of concentration. This plant has been entirely rebuilt, with many improvements, since its description by Mr. W. H. Storms, a little more than a year ago, in Bulletin 6 of the California State Mining Bureau.

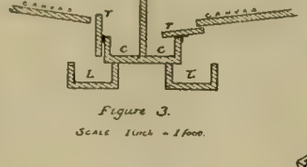


Figure 3.
SCALE 1 inch = 1 foot.

The Kennedy mill has eight batteries of five stamps each and twenty-four 4-foot concentrators. Mr. Gates assumes, to start with, that the coarser portion of the pulp from the mill contains its value enclosed in grains of quartz in such a way that it cannot be recovered on his plant without further crushing. Therefore, first of all, he separates the coarse sand and throws it away, while he saves the fine pulp which contains the fine sulphurets which have escaped the concentrators in the mill, and which he aims to catch on his plant.

The separation of the coarse from the fine is effected in what Mr. Gates calls a "segregator." There are two of these, each constructed as shown in the sketch (Fig. 1). The pulp from the mill enters the distributing boxes, which have a bottom of sheet iron with $\frac{1}{8}$-inch holes. These deliver the pulp in a shower to the separating box of the segregator. In this box the coarse sand settles, while the fine material is kept up by a rising stream of clear water, which is delivered at the very bottom of the pipe and just above the spigot. Sand and water escape steadily from this spigot, which is a $\frac{3}{8}$-inch bushing of iron pipe in a rubber cork. The fine pulp overflows in a sheet over the end of the machine and enters a divided trough with twelve compartments, through which the pulp is distributed to the canvas tables.

The plant has twenty-four working tables arranged in two rows of twelve, facing each other, and sloping together to the tails launders. In addition to these, two extra tables receive the pulp when it is turned off from a pair of the working tables for the purpose of hosing off. The canvas of each table is 12 feet wide and 10 feet long, and is stretched upon a floor with a slope of $1\frac{1}{2}$ inches per foot. The arrangement of distributing troughs and tables is shown in the sketch plan and cross-section (Fig. 2). The device for receiving the tailings and concentrates at the foot of the tables is shown in Fig. 3. While pulp is running over the table the tilting tail (T) is turned so as to deliver into the tails launder (L). After washing, the tail is turned as shown the right, and the concentrates are hosed into the launder (C), which is divided by a splashboard (S).

When the pulp has run on a pair of tables for an hour it is turned of and run to the extras. Clear water is turned on for a few minutes in order to partially clean the sulphurets caught on the canvas. The tilting tail is then turned so as to deliver into the heads launder, and the table swept off with a hose which throws a broom-shaped stream. These concentrates run to a settling box 2 feet by 12 feet by 2 feet deep. The overflow from this box goes to a canvas table and then to the tables which receive also the tails from the vanner mentioned below. The material settled in the tank has a value of about $30 per ton in gold and must be cleaned. It is, therefore, shoveled to a trough, whence it is washed by a small stream of water to a vanner. This is a short, smooth belt and end-shake machine of Mr. Gates' own design. It is run with a very rapid shake, steep slope and thick pulp.

Travel—1 foot in 11 seconds.
Throw—$\frac{7}{16}$ inch.
Shake—240 to 260 per minute.
Slope—$1\frac{1}{16}$ inches per foot.

The tails from the vanner go the table already mentioned, and that in turn discharges to two others in succession. The material caught upon these tables amounts to from two to three tons per month and has an assay value of about $60 per ton. The heads tank of the vanner overflows to three small settling tanks in a series, and the product assays more than $100 per ton.

The flow of the pulp over the tables takes the form of a succession of waves. At the head of the table these waves have a length of five inches from crest to crest and at the foot of the table twelve inches. This does not indicate a corresponding acceleration in the velocity of flow at the foot of the table, but is caused by the retarding of one wave by the sand in front of it until the succeeding wave overtakes it, when they go on together. These waves travel from the top to the bottom of the table (a distance of ten feet) in from 6½ to 8 seconds, as measured with a stop watch, and the depth of the pulp, measured with a micrometer gauge, was:

	1 Foot from Head.	*1 Foot from Tail.*
Crest of waves	.063 to .068 inch.	.068 to .075 inch.
Trough of waves	.050 inch.	.040 to .045 inch.

The Kennedy mill crushes about 100 tons of quartz per day through a No. 30-mesh wire screen, and

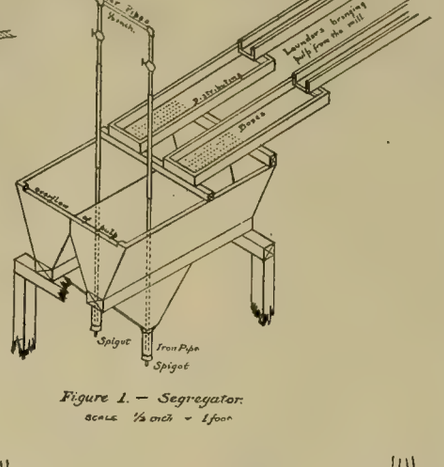

Figure 1. — Segregator.
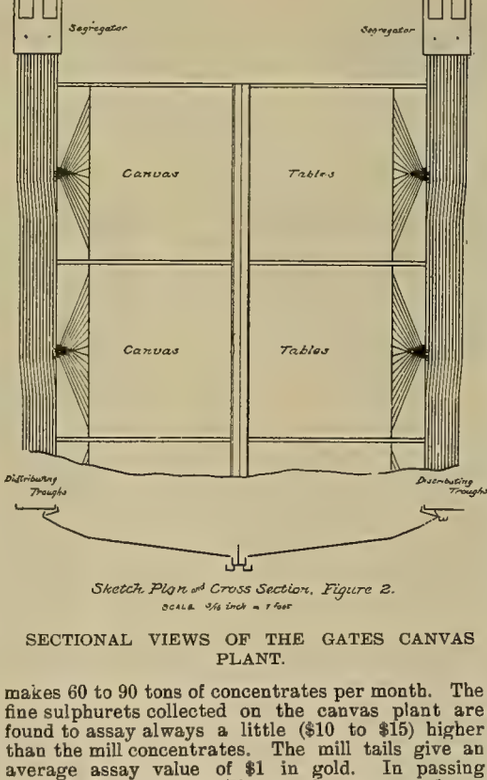
SCALE ½ inch = 1 foot



Sketch Plan and Cross Section, Figure 2.
SCALE 3/16 inch = 1 foot

SECTIONAL VIEWS OF THE GATES CANVAS PLANT.

makes 60 to 90 tons of concentrates per month. The fine sulphurets collected on the canvas plant are found to assay always a little ($10 to $15) higher than the mill concentrates. The mill tails give an average assay value of $1 in gold. In passing through the segregator 70 tons of coarse sand are thrown away and 20 tons of fine slimes are delivered to the tables. No assays of these materials have been made for some time, but Mr. Gates estimates that the fine carries twice or three times as much value per ton as the coarse. The product of the plant is 12 to 16 tons of concentrates per month, with an average assay value of $100 per ton. The product is thus seen to be equivalent in value to about one-third the gross loss from the mill and 70% to 80% of the portion of the pulp actually passing over the tables. The concentrates are shipped to Selby's smelting works.

The amount of water used is estimated by Mr. Gates as follows:

	Miners' Inches.
Received with the pulp from the mill	12
Clear water used in the segregator	3
Clear water used in cleaning and hosing off	1
Total	16

This is verified by measurements made by timing floats with a stop watch in the tails launder. Mr. Gates thinks that the work could not be done with less water. About one inch escapes from the four spigots of the segregators, which could be easily recovered by settling.

Two men, one on each shift, to look after the vanner and hose the tables off once an hour is all the labor necessary. The plant is lighted by one incandescent electric lamp which slides on the conducting wires opposite the tables which are being hosed off. A little power is necessary for the vanner, which is secured at this plant from the tailings on a small overshot wheel.

No. 6 canvas is used which wears eight months, when it must be renewed. During that time it is shifted every four or six weeks, to bring the cracks of the floor in different places. Hot weather affects the canvas badly.

The cost of the plant, including everything, was $2000, with lumber costing $24 to $25 per M. and carpenters $3 per day.

Mr. Gates has secured several patents which cover his methods of separating the sand and slimes and the distribution of the pulp.

The Accumulation of Amalgam on Copper Plates.*

Continued Discussion of the Paper of MR. R. T. BAYLISS, Presented at the Pittsburg Meeting.

Frank Owen, Marble Bar, Western Australia: In connection with the discrepancy observed by Mr. Bayliss in the relative fineness of the bullion obtained by amalgamation on copper plates from the ore containing gold and silver, and the bullion obtained afterwards by scraping the same plates, a somewhat similar experience with a different class of ore may be of interest.

The observation to which I refer was made at the El Silencio mine, situated at Remedios, department of Antioquia, Republic of Colombia. The ore consisted of auriferous (mixed with a little arsenical and occasionally antimonial) pyrites, galena and zinc blende. The proportion of pyrites in the ore ranged from 1 to 12 per cent. The average assay value of the ore was one ounce gold and five ounces silver per long ton. It was mined at a depth of from 220 to 285 feet. The gangue was quartz and the country rock syenitic granite, often much decomposed, so that it was easily crushed. The proportion of silver to gold was found to be considerably higher in the galena than in the pyrites.

The ore was treated in a wooden 16-stamp mill, common in Colombia and Brazil. The shoes were of cast iron, weighing 140 pounds, and the total falling weight was 200 pounds. The mill was run at forty drops of five inches per minute. The screens were of 20-mesh diagonally punched Russia iron. Silver-plated copper plates, 4 feet long by 2 feet 6 inches wide, and set at an inclination of one in twenty, were used outside the battery only and were cleaned up once in twenty-four hours. The usual grade of bullion produced was: Gold, 600; silver, 350; total, 950. The amalgam contained from 55 to 60 per cent of sponge gold, which lost from 1.5 to 2 per cent in melting.

In February, 1891, four old plates, which had been in use from two to two and a half years, were scraped and produced bullion of the value of $22,500. The amalgam obtained by scraping contained from 45 to 50 per cent of sponge gold, which lost from 3 to 4 per cent in melting. The grade of the resultant bullion averaged: Gold, 450; silver, 300; total, 750; whereas, judging from the proportions usually obtained from the plates, one would have expected it to show: Gold, 473; silver, 277. After chipping off all the amalgam as far as practicable, the plates were melted down into thirty auriferous copper bars, which realized $750.

* Trans. Am. Inst. M. E., Colo. Meeting, Sept., '96.

Yield of the Rand.

The total output of gold in the Rand has been 10,072,116 ounces since the gold fields were declared open in 1887 to the end of July, a little over nine years. During the first half of that period the total output aggregated only 1,824,889 ounces, while during the last four years and seven months, ending July 31, 1896, the yield was 8,247,227 ounces. The yield of the first seven months of this year is somewhat short of the average of 1895, but it is increasing each month, and the total will probably considerably exceed the amount produced in 1895—2,227,640 ounces.

With improved processes lower grades of ore are being worked, as will be seen by the following table, which gives the grade shown by milling for the months of July from 1891, inclusive, about which time the cyanide process was beginning to make its influence felt:

	MILL. *Dwts. Per Ton.*	CYANIDE. *Dwts. Per Ton.*
1891	10.63	....
1892	9.49	....
1893	9.89	4.84
1894	8.95	4.25
1895	8.54	4.66
1896	7.50	4.86

Scientific Progress.

The Atom.

Sir Robert Ball, the eminent astronomer, in giving an explanation of the nature of the atom and the devisibility of matter, said lately: "Let us take for our illustration some substance which, as far as we can tell, is absolutely homogeneous, inasmuch as it consists only of a single element. I select for this purpose a piece of iron, and suppose it to be divided into two portions. Let each portion be subdivided again, and yet again, until at last it shall have been reduced to the minutest portion of which our senses can take cognizance. Each one of the little pieces, so obtained, will still possess all the qualities of iron. We shall further imagine that we are provided with some means for carrying on the subdivision of an iron particle to a point much beyond that which any mechanical appliance at our disposal can affect. We shall even suppose that we are able to continue the subdivision of the iron long after the particles have become too minute to be visible, even in the most powerful microscope. Modern science has, however, taught us that though this subdivision can be carried on so far, yet it can not be protracted indefinitely. A point would at last be reached where each of the little particles, though still possessing all the qualities of iron, would refuse to admit of any further subdivision. The particle in question may, no doubt, be composed of parts, but if we could separate those parts they would not be iron, they would not, in fact, be anything like iron. This piece of iron, which can not be further reduced, is called an atom. The derivation of this word indicates that the object to which it is applied is a something which can not be cut. We are thus led to the conception that all matter on the earth or throughout the universe is constituted of aggregations of atoms. The sun itself is no more than an enormously great, though quite definite, number of those ultimate atoms out of which all material objects must be composed.

"We may also illustrate the fineness, so to speak, of the ultimate texture of matter in the following way: Think of a plate of copper possessing the same thickness as the page on which this is printed. It is perfectly certain that if we had machinery by which we could beat out that copper until the plate was reduced to the thousandth part of its present thickness the thin sheet so produced would still be found to present all the characteristics of copper. Even if the sheet could be beaten out ten times more, so that its thickness were ultimately reduced to one ten-thousandth part of that of the original sheet of paper, the substance in the plate would still possess the characteristics, chemical and physical, of actual copper. It can, however, be inferred by an ingenious line of reasoning, given by Lord Kelvin, that if the plate thus attenuated were to undergo a yet further reduction, which would make it to have no more than the millionth part of the thickness of this sheet of paper, then the substance would have ceased to be copper in the sense in which we understand the word. It would approximate to a layer of individual molecules, further subdivision of which would be impossible."

Specialization in Engineering.

Specialization in professional pursuits, in engineering particularly, has become the natural and proper result of the growth of applied science. The civil engineer of past generations, who was supposed to command a comprehensive knowledge of every branch of engineering then practiced, from the design of a steam engine or machine tool to that of a bridge or city drainage system or complete waterworks plant, has virtually ceased to exist, and in his stead we find the steam engineer, the sanitary engineer, the bridge engineer and the engineer of various other subdivisions of the great field of engineering—each an expert in his particular line. It has been found impossible for one man to combine within himself the detail knowledge necessary to practice all these branches with entire success. One branch alone is almost sufficient to make a life study, and the engineering specialist of to-day finds himself busily enough occupied in keeping abreast of the times.—Cassier's Magazine.

LOOKING now over the field of tendency of engineering education, it is seen that there has been ever present a powerful impulse towards specialization, to which, indeed, nearly all others have been subordinated. This has demanded a higher standard of admission, great thoroughness in all fundamental subjects and a rigid adherence to scientific methods. Engineering education has had an active and healthy growth. It now enjoys the respect and confidence of the public, and its future is sure to be more influential than its past. It is not specialization that has caused its success, but rather the methods which specialization has demanded. Those methods have resulted in imparting to students zeal and fidelity, a love of hard work, of veneration for the truths of science and a consciousness of being able to attack and overcome difficulties. These elements of character are, indeed, the foundation of success in life. Looking now forward into the future, it is seen that in our efforts for the promotion of engineering education a wide field for work still lies open. The student should enter the engineering college with a broader training and a more mature judgment. The present methods of instruction are to be rendered more thorough and more scientific. In particular, the fundamental subjects of mathematics, physics and mechanics are to be given a wider scope, while the languages and the humanities are to be so taught as to furnish that broad, general culture needed by every educated man. In general, let it be kept in mind that education is more important than engineering, for the number of men who can follow the active practice of the profession will always be limited. Hence, let it be the object of engineering education to influence the world in those elements of character that the true engineer possesses, so that every graduate may enter upon the duties of life with a spirit of zeal and integrity, with a firm reliance upon scientific laws and methods, and with a courage to do his work so as best to conduce to the highest welfare of his race and his country.—Mansfield Merriman before the Society for the Promotion of Engineering Education, at Buffalo.

LONG before the coal fields of the world are exhausted, there is little doubt the workers on the borderland of engineering will have discovered some plan of tapping the great stores of energy around us, says *Cassier's Magazine*. The very earth we live on is whirling around like a huge flywheel; and if we could only find some way of utilizing its momentum, we could draw upon it for ages for all the power we want. It is, indeed, naturally drawn upon now in various things intimately associated with the work of the harbor and dock engineer. The flow of the tide in enormous volume up and down a river is accompanied by a vast expenditure of power in overcoming the frictional resistance of the river bed, in the grinding of shingle into sand and in the transport of sandbanks from one part of the river to another. Even the flow of the water through the sluices of locks involves a loss of energy, as does the working of a tide mill, which latter is one way of utilizing, as the others are of destroying, some of the earth's momentum. No true engineer will believe that, with so many sources of energy around us, the progress of mankind and the work of the engineer will cease with the exhaustion of our coal fields.

IN twenty-five years the total number of United States patents rose from 98,460 to 568,619. Of the latter number, electric generators claim 3,117; electric railways, 2,019; electric lighting, 3,622; electric power, 1,183; telegraphy, 3,205, and telephony, 2,459.

Electrical Progress.

AN interesting illustration of the utilization of waste water is afforded at the Ontario mine, Park City, Utah. After the completion of their great drain tunnel—more than three miles in length—which taps their lode at a depth of 1500 feet, it was found to have a continuous flow of 1000 cubic feet per minute. This water was piped down the canyon 1600 feet, where a fall of 125 feet was obtained. At this point the power station is located, embracing two Pelton wheels, connected with belt-driven electric generators. The power thus produced is transmitted six and one-half miles to the works of the company and there used for lighting the mine, mill and hoisting works, besides furnishing power for various purposes. The pole line runs over a very rough country at a high elevation, subject to heavy snowfalls and electric storms of great severity. Yet no interruption has occurred to the service, nor have any repairs been required during the two years that it has been in operation.

THE rapidity of the growth of electrical industries in the United States is illustrated by some recently published statistics. It is now only some seventeen years ago since the first electric central station was erected in America; now there are 2,500 separate electric light companies in existence, and in addition 7,700 municipal and other isolated plants. The capital invested in these is estimated at $500,000,000. These establishments are reckoned to require daily from 50,000 to 75,000 incandescent lamps, while they consume annually 200,000,000 carbons. Against the electric railways in Europe, under 100 altogether, there are now running in the United States about 900, covering 11,000 miles of track and representing a capital estimated at $100,000,000. All this has been the work of less than seventeen years.

PRESIDENT G. TRACY ROGERS, in his annual address before the New York street railway convention, said that the experience of the past year has demonstrated that where very long lines of street railways are to be operated, power can be economically delivered twenty miles or more from the power station by the three-phase system and the use of high-tension current. The experience of the past year has also demonstrated that with direct-current machines, longer lines than we had previously supposed can, by the addition of boosters, be operated economically. Some fifteen or twenty different roads in the United States are now using this system.

JOHN JACOB ASTOR'S yacht—the Utopian—the largest yet constructed, to be operated by electricity, was launched Sept. 10. Four hundred and eighty cells of battery are to be installed for the operation of two 25-horse power motors. It is said that the installment will carry power for fourteen running hours. The yacht is fitted with a system of bells, arranged so that the helmsman can signal aft, and will be lighted electrically. Her main dimensions are: 72 feet long over all, 12 feet beam and 4 feet draught.

MR. TROTTER, in a recent lecture before the South African Philosophical Society, says a London exchange, plunged a steel knife and a silver fork into an orange, forming a battery by which he was able to send signals over one of the long-distance telegraph lines to Port Elizabeth from Cape Town, including a resistance composed of a row of persons joining hands.

IT is reported that a company is to be formed in Sweden for the smelting of ores on a large scale under the De Laval patents for electric smelting. The Swedish Government has granted a concession for the establishment of the company, which will have a capital of £750,000. The water power at Trolhattan will be utilized.

ACCORDING to the London *Daily News* M. Kildischewsky, a Russian electrician, has discovered an improvement in the telephone, by the use of which distance has no effect upon the hearing. In a recent experiment between Moscow and Rostoff, on the Don, a distance of 890 miles, talking, music and singing were heard with perfect distinctness. An ordinary telegraph wire was used. It was said that M. Kildischewsky will go to London to experiment with his improvement on the Atlantic cables between London and New York.

Mechanical Progress.

The Chicago Tower.

The Chicago Tower Company, recently organized with a capital stock of $1,000,000, will erect on the West Side a tower 1150 feet in height—202 feet higher than the Eiffel Tower in Paris. The foundation will consist of four four-cornered supports, each 50 feet square, and meeting in an arch 200 feet wide and high. On top of these arches will be a vast landing 250 feet square and capable of accommodating 20,000 people. There will be six other landings, with a capacity of 20,000 more, each smaller than the one below. The topmost will be provided with a powerful searchlight and telescope. Sixteen elevators will carry passengers to the first landing, eight to the second, six to the third, and from there four cars will take passengers to the 1000-foot landing. A theater, restaurant, booths and exhibits of every description will occupy the landings. Electrical displays will be made from the top landing at night. Many other features will be added for the amusement of persons visiting the tower. The estimated cost of the structure will be $800,000. The annual income is expected to exceed $300,000 and the cost of management $50,000. Bathroom, barber and florist shops, delicacy booths and convention rooms are devised in the plans as means of revenue. On each landing will be telegraph and telephone stations. Fireworks exhibitions will be given and the concert halls are expected to afford considerable income.—Chicago Journal of Commerce.

ON the question of fenders the president of the New York State Street Railway Convention said the other day: "The question of fenders is still confronting us, and is a most perplexing problem. More patents for street-car fenders have been granted during the past few years than for any other class of inventions. It is stated upon good authority that there are upwards of 4000 on the market. It is the opinion of many street railway men that the fender is a menace. Your executive committee were anxious that an act be passed regarding fenders. There were a number introduced. The one introduced by the chairman of the Assembly Railway Committee seemed to meet the approval of the public and was heartily indorsed by your executive committee, but for some reason it never became a law. The street railways are anxious that the State should share some of the responsibility. I stated last year, and still believe, that the best fender for the front end of a car is a clear-headed motorman."

THE Commissioner of Patents, in his report on the business of the Patent Office for the fiscal year ending June 30 last, shows that 48,105 applications and caveats had been received, 24,585 patents granted and trade-marks, labels and prints registered, and 15,580 patents withheld and patents expired. Receipts from all sources during the year were $1,307,090 and expenditures $1,097,368, leaving a surplus of $209,721. The balance in the Treasury of the United States on account of the

patent fund on June 30, 1895, was $4,566,757, making a total, with the 1896 surplus, of $4,776,479. Applications awaiting action number 8943.

THE Trans-Mississippi and International Exposition will be held at Omaha in 1898, for the conditions of the $200,000 national appropriation have been met. In that city, it is said, $313,000 worth of stock has been placed, $40,000 additional is in sight, and such subscriptions as $10,000 from Chicago, and those of 5000 individual stockholders, make the amount set—half a million dollars—assured. Fifty directors and a working force will be appointed on the first of October.

NEARLY every article representing an important part of the basis of material for the operation of industrial establishments in this country shows a very great increase in excess of the gain in population during the past ten years, says the Chicago *Journal of Commerce*. From 1885 to 1895 there was a gain in population of 25 per cent, while the general average gain of production of pig iron, coal, copper, zinc and lead was approximately 50 per cent.

Practical Information.

The Naval Academy and Education of Engineers.

The charges filed by Capt. Cooper, superintendent of the United States Naval Academy against Commodore Melville, the engineer-in-chief of the Navy, it is understood are based on statements made by the engineer-in-chief in an article printed in the *North American Review*, in which the words occur: "Annapolis is either unable or unwilling to train naval engineers, and, if its work is brought into comparison with that of other institutions, the naval academy will be compelled to extend its engineering curriculum or show cause for its existence." As to the official standing of the report of the superintendent, it may be said that the United States Navy regulations require officers of all grades to obtain the permission of the Secretary before giving their views in print. That this permission was given in this case does not admit of doubt, and, since the publication of the article was thus authorized, no charges founded upon it would seem to carry weight, especially with so impartial an official as the present Secretary of the Navy.

Moreover, the propriety of the views of the engineer-in-chief is beyond question. The institution at Annapolis had at one time a notably thorough engineering course. In recent years, however, there has been a change. The special course of four years for cadet engineering has been abolished; all cadets receive the same instruction for three years, and it is only during the fourth and last year that professional studies are pursued by the cadets transferred at that time to the engineer division. The reason for this change, in a navy which has become wholly engineering, can be only that indicated by a candid officer of the line, who is reported to have said: "The engineers were getting so many able men that we had to stop it, otherwise as they came over one gangway they would have driven us over the other. It seems to have been a question of the preservation of the prestige of the line branch."—Cassier's Magazine.

IN the *Annales de Micrographie*, M. Miquel gives statistics for ten years of the numbers of bacteria in a cubic meter of air, both in the center of Paris and in the park of Montsouris. In consequence of local improvements, the air in the park has gradually become purer, the number of bacteria having decreased from 480 per cubic meter in 1884 to 275 in 1893; but the air in Paris itself has increased in micro-organisms from 3,480 in 1884 to 6,040 in 1893. This large increase, M. Miquel attributes to the greater cleanliness of the inhabitants, who, by dusting out and cleaning their houses and shaking carpets, etc., stir a large quantity of germs into the air. He even goes so far as to condemn this form of cleanliness, on the ground that the germs are simply blown about by the wind, and find their way into the house again, so that if you do not get your own germs back, those from your neighbors fly in at the window instead.

IN no other country is the railroad mileage near as large relatively to the number of inhabitants as in the United States. The chief nations of Europe have one mile of railroad to an average of 2600 people, while in this country the average is 380 inhabitants to one mile of road. This is the result of the competition between different railroad companies. In Iowa, where the fight is perhaps bitterest, the number of inhabitants to one mile of road is only 243; while Germany, with very nearly the same amount of mileage, has 1895 inhabitants to the mile—a number nearly eight times as great.

FOR many years, during the time that rag paper or straw paper was the standard, Great Britain stood at the head of the world's producers and manufactured not only sufficient for the home demand, but also had a surplus left over for export, whereas the American product of paper was insufficient for home demand. With the discovery of the utility of wood pulp for paper making and the process whereby the cost of paper has been reduced, the United States has been steadily pushing ahead and are now in advance of Great Britain. Germany follows Great Britain closely.

A COMPARISON of the teeth of dwellers in granitic and calcareous districts establishes the fact that the worst teeth of the calcareous districts are always better than the very best teeth found within the non-calcareous districts.

Lifetime Furniture.

Furniture should last a lifetime; it will if rightly bought.

Economy isn't buying the cheapest you can, it's getting a good money's worth.

A Bedroom-Set Hint:

Like picture, solid oak, carved and polished; Cheval dressing mirror—large glass; wash stand to match (no picture).

$24 is the price.

You might find our new furniture catalogue handy; over 100 pages, nicely illustrated. Free.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1890 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMBINED PLOW AND SEEDER.—James Porteous, Fresno, Cal. No. 568,100. Dated Sept. 22, 1896. This invention relates to that class of agricultural implements in which the parts and functions of a gang plow and a seeding machine are combined. The object of the invention is to simplify the combination by an intimate union of the parts performing the two general functions, providing a distinctly single implement and one which employs drills arranged to the best advantage for simplicity of construction and effectiveness in operation. The implement consists of a plow frame having its plow bottoms arranged in a line inclined to the line of draft, a seed-box supported on said frame and provided with suitable discharging mechanism, drill shoes arranged in a line parallel with the line of the plows, flexible conveyors from the seed-box to said shoes and colters or shares of said shoes, the arms of which extend up to and are pivotally connected with the plow frame.

THERAPEUTIC ELECTRODE.—John Severn Muir, Stockton, Cal. No. 568,095. Dated Sept. 22, 1896. This invention relates to the class of electrodes used in the administration of electricity for therapeutic purposes. The device consists of an electrode composed of a backing of leather, cloth or any other suitable material which is a non-conductor of electricity. To the face surface of this backing is attached, by stitching or cementation, a flexible sheet of metallic or semi-metallic electro conducting material, and on the face surface of tis sheet of metallic or semi-metallic substance is spread a pliable compound containing as part of its composition an electro-conducting substance. The general object of the invention is to provide a durable and perfect therapeutic electrode which is adapted to be readily applied to any portion of the body, fitting it perfectly throughout its entire surface, and so constructed that it can be used dry, avoiding the necessity of moistening or wetting it, said electrode being adapted to distribute the electric current equally and smoothly over that portion of the body to which it is applied, and on account of its even distribution of the current, permitting the use of much larger currents than by other forms of electrodes.

Coast Industrial Notes.

—A scheme is on foot at Los Angeles to build an electric railway from that city out to La Canyada valley.

—It is reported that the entire catch of seals in Bering sea the past season will not be half that of last year.

—The U. S. monitor Monadnock anchored last Sunday in Humboldt bay—the first warship that ever entered that harbor.

—The steamship Hupeh, which sailed for the Orient last week, carried away one of the largest flour cargoes that ever left for China and Japan, the total amount being over 30,000 barrels, valued at $84,577. It also carried 8306 bushels of wheat, valued at $4485, for Nagasaki and Kobe.

—The Puget sound sawmill proprietors have made a $100,000 contract with Japanese concerns for supplying 12,000,000 feet of lumber, to be shipped at once to northern Japan. The steamship Konoura Maru, which is to transport the first consignment, 1,800,000 feet, has arrived at Seattle.

Personal.

CAPTAIN COUCH has returned to Butte, Montana, from England. He did not go to South Africa. It is said by a Boston paper that he will return to this State to take charge of the Merced properties.

CAPTAIN THOMAS MEIN, who has returned here after four years' absence in South Africa, will look after the interests of the Exploration Company on this coast. These include the Oneida mine, properties at Minas Prietas in Mexico, the Steeple Rock properties in New Mexico, mines in southern Oregon and an interest in the Alaska-Treadwell mines.

E. B. DORSEY, formerly a well-known mining engineer on the Comstock where he built the old Mexican mill, returned to this city last week for the first time in seventeen years. He is residing most of the time in London and has come out here in the interest of some capitalists to look up mining properties.

THERE have arrived in Butte, Montana, two men from Paris, Emil du Marias and Emil P. Euders, who came out, it is understood, under the auspices of the French Government to make a general report upon mining districts of this country and British Columbia. Some years ago they made a tour of the South African gold fields for the same purpose.

Recently Declared Mining Dividends.

Cedar Canyon Mining Company, British Columbia, $24,000, payable Sept. 1st.

Homestake Mining Company, Deadwood, S. D., $31,250, payable Sept. 25th—a total of $5,993,750 to date.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

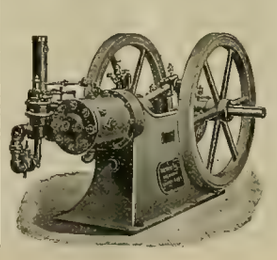
Hercules Gas, Gasoline and Distillate Engines.



Hoisting Engines 2 h.p. to 200 h.p. Stationary Engines 1 h.p. to 200 h.p. Marine Engines 2 h.p. to 200 h.p.
Our newly designed and perfected DISTILLATE VAPORIZER insures a saving of 50% on cost of running.
Just ½ your expense saved by using a HERCULES in place of any other. We make no exception.
Nearly 3000 HERCULES Hoisting, Stationary and Marine Engines in Actual Use. High Grade.
We claim full power, automatic and positive adjustment regulating speed and consumption of fuel in proportion to work being performed. No spring electrodes to burn out. All springs are outside. Point of ignition, speed and amount of fuel can be changed while engine is in operation.

Mining Summary.

CALIFORNIA.

Amador.

Republican: There are fifty-two men employed in the Union mine at Pine Grove, and as soon as the improvements on the 30-stamp mill are completed a number more will be added. The shaft is down 400 feet, and the ledge improves as they go deeper.

At the Kennedy mine the new level opened up at 2150 feet has encountered the ore body and it is found to be equal in size and fully as rich as that worked in the 1950 level.

At the Anita mine the east drift at the 500-foot level has reached a point 40 feet from the shaft. The face is in a slatey formation, indicating a near approach to the ledge. It was calculated that between 40 and 50 feet would suffice to tap the ore body.

The old Dane mine, just below the Reward, is being opened up.

Ledger: The first section on the new hoist at the Oneida is in position and work is progressing on the second section. The shaft is now down about 430 feet and harder rock has been encountered, but it breaks better, so the month's work will be about the same as last, 50 feet.

The Blue Lakes Company have a force of twenty men at work on the power site near Tripp's, on the Mokelumne river.

The Boston mine has shut down pending necessary development work. They have been operating through a single-compartment shaft and have concluded to increase its size. They have placed an order for timbers to construct 800 feet of shaft, and when that is on the ground they will probably renew operations.

Republican: In the Pioneer district Mason & Griesbach have cleaned up after a 250-ton run in the Gracey mill with ore from the Madrone mine. They intend crushing again in October.

Chase & Hawkins are doing development work on a claim they have bonded on Pioneer creek.

The White brothers are working a large force of men. They have been delayed in the preliminary work.

The Pinnavita is still taking out rock. The sulphurets in this vein run very high. They expect to crush a 50-ton lot in the Gracey mill in a short time.

Taylor & Atkinson have a large dump of good ore. They also propose crushing in a couple of weeks.

The Contention, or old Belden, is still lying idle, although report says it will start up soon.

Chicago parties are negotiating for the Madrone mine; also, Casinelli's group, including the Pioneer.

At Sutter Creek, Prince Geo. Greancaux, a recent arrival from France, is consulting with Senator Voorhies in relation to mining interests on the mother lode.

There is talk of starting up the Farrell mine and mill on the Mokelumne river. This is the last mine on the mother lode in Amador county, and has been idle for some time.

Butte.

At the Forty-nine mine, on Red Point mountain, near Forbestown, one of the properties of the Oregon Gold Mining Company, a new ditch is being constructed from the Forbestown ditch to the top of the mountain, to convey water for generating power for the mine. The upper tunnel has exposed a ledge 31 feet wide, the ore of which will average $8. The lower tunnel is being pushed ahead to reach the same pay chute at a depth of 32 feet, and it is expected to strike it within 100 feet. The owners will begin the erection of a mill as soon as this tunnel determines what size it should be.

Register: Near Enterprise James O. Carlisle has reached in his mine, the Betsy, a rich body of ore.

Shaw & Co., the owners of the Golden Fissure mine, are preparing to build a new quartz mill on their property, the ledge having shown good rock since its development.

E. Otto Miller has for seven years been mining on Main Butte creek and at times has made as high as $30 per day to the man. The mine has paid for all development work and has paid the owner good wages during the entire time.

Register: At Forbestown the force has been withdrawn for the present from the Goldbank tunnel, but these men are working to reach the ore in the Golden Queen mine which will be crushed in the Goldbank mill.

The Missouri mine has been bonded and not less than $15,000 will be expended in opening and working it.

A deposit of good quartz has been found in the Denver mine and the mill was started up on this rock last week.

The ledge in the Betsy mine owned by J. O. Carlisle is from 15 to 20 feet wide and shows up well.

Calaveras.

Angels *Voice*: A deal has been consummated by W. C. Ralston on the Malones property at Carson Hill. Eastern capital will at once take hold and work the property. The Melones group includes the Reserve, Point Rock, Mineral Mountain and Melones proper. It is expected that the ledge will be worked from both Carson Hill and Robinson's Ferry.

Mountain Echo: At the Gold Hill mine at Smith's Flat it is the intention to put the shaft down 500 feet before running any levels.

It is reported that operations have ceased at the Bear Mountain mine, the men having quit work because their pay for labor was not forthcoming.

Chronicle: A cleanup made at the Roanoke mine last week from a run of twenty days with the 20-stamp mill yielded $10,000. Work at the mine is going steadily on and good ore is being encountered.

Some good gravel is being taken out of the Rising Star mine near Central Hill. A shaft to tap the channel was sunk, and at a depth of 130 feet the gravel was struck, which it is said will yield $4 to the ton, and the depth is not known, as bedrock has not yet been reached. A new hoist and other machinery are soon to be put on the ground.

Citizen: All the timber and machinery for the new 40-stamp mill at the Gwin mine is on the ground, and the mill is well under way. Captain F. F. Thomas says that the stamps will be dropping by the 1st of November.

A rich body of gravel was struck at Central Hill last week.

Sinking on the Ghost mine at Angels is progressing steadily.

It is the intention of the management of the Gold Hill mine at Smith's Flat to sink the shaft to a depth of 500 feet before running levels.

The old Petticoat mine at Railroad Flat is about to start up under the management of W. H. Clary, Jr. A hoist is being erected and other work being done preparatory to cleaning out the old shaft.

The Ford Mining Company have purchased a new 50 H. P. boiler for their mine.

The California Debris Commissioners have granted the owners of the Aleyone mine near Angels permission to build restraining dams across San Domingo creek—a tributary of the Calaveras river.

The owners of the Barnhardt mine near Old gulch have completed their restraining dam according to the instructions of the Debris Commissioners, and are awaiting the inspection of the work by the engineer of the Commission.

El Dorado.

(Special Correspondence).—A rich ore body of good size was discovered last week in developing the Marguerite, three miles south of town. This property adjoins the Larkin on the east.

Work is progressing rapidly on the Griffith Consolidated. The new hoist is about completed and the shaft will soon be clear of water and retimbered.

The machinery for the new mill on the Baltic is all on the ground and will soon be in operation.

The framework for the new mill on the Larkin is almost completed. The hoist is finished. The underground work, shaft and drifts amount to something over 500 feet.

John Ewarts has begun a tunnel one mile south of town on a drift property which he expects to operate on a large scale during the coming winter. This will be known as the Eureka mine.

In the Zantgraf, twenty-five miles southwest of Placerville, they are running twenty stamps and employ sixty-five men. It is claimed that this mill has the heaviest battery timbers in the State. The stamps weigh 1000 pounds. There are 1900 feet of tunnel, 1400 feet of levels, a 530-foot shaft and a 2¼-foot ledge. T. F. Chapman is superintendent.

Three representatives of English capitalists were in town last week and made examinations of as many properties. If satisfactory arrangements can be made for prices and funds the negotiations will be closed before long.

N. G. Sturtevant & Son are making good progress on their property near El Dorado. They find a good ore body of fair grade quartz.

Placerville, Sept. 27, '96.

Kern.

Californian: Sixty-five tons of Randsburg ore has been cleaned up in the last ten days. A run made for the James Bros., Garlock & Simpson netted about $75 per ton.

The Amalie mine, owned by W. E. Rogers, is said to be turning out a silver bonanza. The new hoisting works are now in operation, and rich ore is being taken out on the 300-foot level.

Madera.

(Special Correspondence).—At Grub Gulch mining matters are lively and show more promise than for many years past. Within 30 to 60 days several large properties that are now inoperative for lack of water will resume work. With the cooler weather water is on the increase. Springs are yielding more freely and the Fresno river is beginning to run a little stronger. Grub Gulch is 12 miles from Raymond on the S. P. R. R., over one of the best mountain stage roads in the State. It is a prosperous little camp. There are at present no idle men, but all demands for labor are fully supplied. Wages are $3 a day for miners and $2.50 for men above ground.

The Gambetta mine, Gambetta G. M. Co. owner, is situated about one-half mile west of Grub Gulch. About 30 men are employed. There is a mill, hoisting plant, ore concentrators, etc. The principal value of the ore is in the sulphurets which are high grade. The vein is small but rich. The main working shaft is down 400 feet. Below the level a winze is sunk another 100 feet and the rock is now being taken from the 500-level. The plant is driven by steam power. There is plenty of wood in the district, which costs about $3.50 a cord delivered. Mining timbers run from 5 to 10 cents per lineal foot, while lumber is quoted at $17.50 per 1000 feet, board measure, delivered.

The Mammoth mine, Mammoth G. M. Co. owner, is about half a mile northeast of Grub Gulch. It is closed down at present but everything is being put in order to resume operations at once. Upwards of $65,000 has been spent on an electrical power plant which works to perfection. The water for the generation of the electrical power is taken from a dam in the Fresno river at a point about four miles above Grub Gulch and thence by ditch and flume to the power house. At the power house there is a wheel and pump which raises water to a tank on the side of the mountain. Here there is another pump, worked by electricity which pumps the water over the mountain to the mine. There is a good 10-stamp mill, concentrators, pumps, hoisting plant, etc.

The Starlight is an extension of the Mammoth and is now opening up well. About 12 men are employed mostly in sinking. They have exposed a vein of from 8 to 10 feet in width, of good milling rock. A first-class new hoisting plant has just been completed.

The Savannah mine, Charles W. Haskell, superintendent, is 2½ miles east of Grub Gulch, on an extension of the Mammoth lode. There are three shafts from 175 to 300 feet in depth, all showing fine ore. The Savannah ground comprises four full claims. There is a 10-stamp mill, concentrators, hoisting plant, air compressor, rock drills, etc., and the number of stamps is to be doubled shortly. The motive power is water from the Fresno river, and at present owing to the low state of the river the mill is shut down. It will be running again before the end of October.

Altogether there are over twenty locations on the Mammoth lode and there are some very favorable prospects outside of the principal mines mentioned. It is a contact vein, slate in foot wall and granite in the hanging.

The Potter Ridge mining district is five miles east of Grub Gulch. The most northwesterly location is the Enterprise group, where with a 10-stamp mill the Enterprise G. M. Co. are said to have turned out over $2,000,000. At present it is closed down awaiting the introduction of heavier plant. The depth reached is only 600 feet but the machinery on the ground is too light for the work.

To the eastward and on the same vein is the Syndicate group, which with an arastra is said to have produced over $50,000. This property was better known as the Lucky Bill, when owned by Sheriff R. A. Prouty of Mariposa and others. For four years but little work has been done. It has this month been bonded to John S. Wilbur of San Francisco, and work will be commenced by a stock company within 30 days. At 100 feet there is a vein running northwest and southeast, and over 12 feet in thickness in walls of slate. This vein is said to average from $18 to $24 a ton. A 10-stamp mill and complete equipment is to be erected at once. Water power from the Fresno river will be used, the dam and ditch having been already constructed. From the mine to the mill site is about 3000 feet with a fall of about 700 feet. The ore will be transported by a gravity road. All the conditions are favorable for economical working, and the cost of mining and milling should not exceed $3 a ton at the outside.

Considerable interest is taken in operations at the Buckskin, a new prospect to the eastward of the Syndicate group, and located on the same vein. Eleven locations have already been made on this vein, so far as it is prospected. At the Buckskin the croppings have assayed as high as $120 per ton, and an average of a number of assays gives about half that amount.

Grub Gulch, Sept. 28, '96.

Mariposa.

(Special Correspondence). — The Mariposa Electrical Power Company have men at work on the aqueduct below the Broadhead dam. Charles T. Lindner, the general manager, is daily expected on the ground, to put more men on the work. Several mine owners have entered into contracts to use the power at the rate of $5 per H. P. a month, the power to be installed at the expense of the company.

The Bunker's G. M. Co., W. B. McSherry superintendent, are carrying on considerable operations about five miles southeast of Coulterville. The directors of the company propose to erect a 10-stamp mill at once. They have a quantity of very good looking rock awaiting crushing.

The Tyro mine is crushing rock from the 700-foot level that averages over $20 a ton. Joseph Buttgenbach, the president of the company, has made a contract with the Mariposa Electric Power Company and is about to increase the number of stamps from ten to twenty.

J. J. Dolan has taken a working bond on the Warren mine at the back of Date's Flat, near the head of Gentry's gulch.

J. Adams has bonded his claims north of the Louisiana, on the north fork of the Merced river, to J. C. Donaldson, C. E., formerly of Australia. Till recently Mr. Donaldson has been assistant engineer on the Valley Railroad. He has opened up the Adams claims in a number of places, exposing a strong, well-defined vein of good milling ore. This may become a large tunneling proposition, well adapted for economical working, as by driving from the north fork, in which there is sufficient water for power, about 1000 feet of backs could probably be obtained.

At the Louisiana, A. C. Cable superintendent, the shaft is down over 200 feet. No drifting has yet been done. About thirty men are employed. The mine is to be thoroughly prospected to at least 500 feet before a mill is put up. Operations here are on a model of scientific, economical and systematic mining.

The Bondurant mine, C. F. Bruner superintendent, is bonded to F. E. French, treasurer of the Boston-Mariposa G. M. Co. Beyond keeping the pumps going and taking a few samples for mill tests, no work is being done.

At the Reynolds mine, James S. Reynolds in charge, the Richland G. M. Co. of San Francisco is carrying on development work by drifting on the 100-foot level. They are working on a vein from 2½ to 6 feet wide that is said to average about $15 per ton, and appear to be well satisfied with their prospects.

At Pinon Blanco little work is being done pending the return of Captain A. H. Ward, who is in New York in connection with the affairs of the Mariposa Electric Power Company, of which he is president.

The owners of the Sellick mine at Haywards—Messrs. Sellick, Elliott & Clapp—are in San Francisco, arranging for new machinery. They are expected back next week, by which time Mr. Hensley, the superintendent, expects to crosscut the ledge in the main shaft.

Angus Mackintosh, who recently bought the Hayseed and Triumph mines from the Messrs. Helms at Whitlocks, is in San Francisco, buying machinery. On Mr. Mackintosh's return work is to be started up in good shape.

Charles E. Stuart, at the Dorse mine, near Hornitos, is now down over 300 feet, and keeps on sinking. He is apparently well satisfied and has bought the mine, which was previously worked under a bond.

Messrs. Goodall, Perkins & Co. have begun work on the Barrett and New York claims in Hunter's valley. It is a tunneling proposition and they have sent up rails, cars and other material necessary for a big lot of tunneling.

Coulterville, Sept. 30, '96.

Gazette: William Doolittle of San Francisco has bonded the Geary mine, on Whitlocks, and another mine in the same neighborhood, and has commenced to work them.

Nevada.

Telegraph: The Pennsylvania mine has developed a large vein of good ore.

Tidings: A new 10-stamp quartz mill has arrived at Nevada City for the Cadmus mine. It will be erected without delay.

The Gold Hill Mining Company have leased the Rogers mill and are now putting it in order. The mill will be run by electricity and the necessary machinery has already been ordered.

Placer.

Colfax *Sentinel*: At the Mayflower it is believed that the old upper Paragon lead of gravel has been struck at a point 178 feet on the upraise which the company has been running.

Plumas.

Independent: At the Thistle Shaft drift mine about seventy-five men are employed, putting out from 275 to 300 loads of pay dirt a day. This force will be increased as soon as the work of retimbering a portion of the shaft, which will be commenced next month, is completed. The company owns over six miles of ground along the Gibsonville ridge.

An incipient mining boom has been making its presence felt on the hills back of town.

San Diego.

Los Angeles *Times*: Mat Wormer, a prospector, is reported to have uncovered a vein of tellurium ore four miles below Cuyamaca Dam, on Boulder Creek, samples of which show well in gold.

Shasta.

Free Press: James Eligh and Louis Reel are about to sell the Banghart mine at Whiskytown. They own together 7500 feet of mining ground in placers and seams. These seams have been prospected 100 feet deep and proven rich. The proposed purchasers will make many improvements.

Sierra.

At the Sierra Buttes No. 2 the new 10-stamp mill will be running in about two weeks. There is a 30-foot ledge in sight, from which stoping will begin in a short time.

Enterprise: A large force of men is being employed at the North America and Bunker Hill mines, where recently a large block of undeveloped ground was worked with a yield of $12,000.

Siskiyou.

Journal: The Columbia mine, near Scott Bar, has been producing ore the past few months, and the crushing which that company have had at their mill on Mill creek has given them good results.

Chamberlain & Timmons will soon commence crushing with their new mill on Mill creek. They now have over 200 tons of quartz on the dump, and the mill will be kept running until they have it all crushed.

The Nebraska mill, on Cherry creek, which was shut down a short time ago, will probably be started up again before long.

The Klamath River Dredging Company have been working near Oak Bar for some time past.

The 5-stamp mill, which was erected at the big quartz ledge on French creek some time ago, will be taken to a smaller ledge belonging to A. Erno.

The miners along the Klamath are doing good work and will continue until the cold weather drives them out.

Tuolumne.

Union-Democrat: At the Punter they have stopped sinking and are now drifting north of the shaft on the 140 level. At the face of the drift there is a good ore body, upon which considerable work of exploration will be done.

At the Confidence the big pumps have cleared the mine of water and the work of exploring the ore bodies is being pushed.

At the Jumper nearly sixty tons per day is milled and the payroll amounts to $8000 per month. The ore coming from the New Era drift is high grade.

Frank Enzensperger has started work on the North Star for his Salt Lake and Denver company. A shaft will be sunk this winter and considerable development done.

In the Alameda the upraise being driven from the tunnel to the surface, a distance of 231 feet, will be through in about two weeks, when an incline shaft will be started and sent down 400 feet. Levels will be driven every 100 feet and the claim opened up.

At the App the water is now down below the 800-foot level, and for the first time in years the mine is dry. The ore chute on the lower levels is stronger than above. The new air compressor is running.

The new cyanide plant at the Black Oak is giving satisfaction in treating the ores from that mine.

Work on the Eagle tunnel has been resumed and will be prosecuted until a connection with the Shawmut is made.

NEVADA.

The Golden Eagle Company proposes to erect a concentrator on its property in Hum-

boldt county this season. The mine shows a good body of ore that carries $20 in gold and twenty-five ounces silver.

At the Dexter mine in Tuscarora $8000 worth of bullion was the product of the cyanide plant from an eight days' run.

White Pine *News:* Orson Hudson and Frank Kell, in a recent clean-up from their placer diggings, in Osceola district, took out $800, the result of twenty-four days' run.

Reno *Gazette:* At Austin the citizens are awakening to a new era owing to the big strike in the new tunnel that is being run under the old mines near Austin. The projectors of the tunnel have struck rich ore and the work is being pushed with all the speed possible. A 20-stamp mill is being built to work the ore. It is of a rebellious character and will be hard to work.

OREGON.

Democratic Times: The new road into the Bohemia mining district is almost completed, and will be finished in a few weeks.

Capital is being interested in the development of the deep gravel deposits west of Waldo.

A force of men are at the Illinois copper mines getting the smelter ready for operation.

Jones & Otten of Woodville are running the Hammersly mine and have twenty-two men employed.

BRITISH COLUMBIA.

A Victoria syndicate has purchased of S. McKay and J. Glass the Picnic and Eclipse, two properties on Deer Park mountain, for $25,000 in cash.

Spokesman-Review: The Trilby mine, which lies to the east of the Maid of Erin, at Rossland, has been sold to John P. McMartin for $10,000 cash. Mr. McMartin has also purchased for cash the Prince of Wales, still farther to the east, and adjoining the Southern Cross claim.

North and Govan, representatives of an English development company, have bonded the Prospector group, which consists of the Prospector, Little Flo, Victoria and Handy claims, situated on Porcupine mountain. The purchasers bind themselves to expend $5000 in development work at once, and to pay the vendors $150,000 within a year.

The owners of the Galena Farm, east of Slocan, contemplate the erection of a 200-ton concentrator in the near future.

The new shaft house of the Nickel Plate is completed and ready for the machinery.

The Crown Point is shipping fifteen tons of ore daily and the War Eagle is shipping forty tons to Trail.

Spokane *Chronicle:* A California syndicate has offered $40,000 for the Silver Bell on the south fork of the Slocan, but it was refused.

The Wild Goose group in the Slocan has been bonded by Evans, Coleman & Evans for $40,000. The group includes the Corinth and several other claims.

The Thompson group on Five-Mile creek has also been bonded by English parties for $40,000.

The Carnation, situated just above the Kuth at Sandon, has been sold by Hugh Mann for $10,500 to the Mitchells of Winnepeg.

E. H. Tombinson and Dr. W. A. Hendryx are to consolidate their Slocan mines in a corporation to be known as the Last Chance Mining Company. The company property will consist of more than a hundred acres of solid ground extending from Noble Five camp westward to the R. E. Lee and northward to the Northern Belle and Antoine mines. The Last Chance has shipped over 500 tons of high-grade galena ore and has several hundred tons blocked out in the mine to be shipped when rawhiding begins. A lower tunnel is now in 250 feet, that, when completed at about 1500 feet, will give 600 feet in depth on the developed veins.

UTAH.

Tribune: Surveyors are on the Northern Light at Ophir, preparing for the construction of the projected mill. It is understood that it is to be completed by January 1st and that there is now blocked out in the mine ore enough to run the plant for an indefinite period.

A Chicago syndicate has purchased of E. J. Carter 200,000 shares of stock in the property of the East Golden Gate Mining Company at Mercur.

At American Fork canyon, on the Live Yankee, of which it is said that its output last year amounted to over $50,000, there are now but two men employed; nor is the force likely to be increased until the litigation which is now on is disposed of.

Tribune: J. C. Taylor has secured a lease and bond on six claims on Silverado mountain, assays from which show as much as $25 in gold and 91 ounces in silver. The pay streak is small, but the formation is identical with that which prevails in neighboring claims that have been productive of large amounts of high-grade ore.

Tribune: A project is being agitated for the drainage of the mines of Alta and the systematic exploration of levels below the watermark. The fortunes that rewarded the pioneers were all taken from levels above it, the owners suspending operations upon encountering the warter. This was so with the Flagstaff, the Emma, and the case of all the others. The project has in view the putting in of a tunnel from a point between the Emma mine and Wasatch. Such an undertaking means the expenditure of a large amount of money, but those who are urging it believe that below the water there will be found a higher grade of ore than was mined above. It would materially reduce the cost of transportation between the mines an the railway.

O. G. Elking is working gold placer mines at West Water. He works with a small hydraulic ram and uses magnetized plates. Last month he and three companions earned $300 apiece from the placers. They will largely increase their machinery and force of workmen in October.

At Mercur, C. H. Scheu continues development of the La Cigale group, in the western foothills, and has just let another contract for 50 feet of sinking, which will give a depth of 200 feet.

The Sunshine continues to put out a very good class of ore, and the opinion is expressed that it will become one of the most productive in the camp.

The Marion is providing means for converting its cyanides into bullion at the mill and in a short time will be sending the earnings direct to the mint instead of a refinery.

At Tintic, a new strike of ore is reported in the west drift from the 200 level of the Ajax. A small sample of ore taken out a few days ago showed 73 per cent lead.

Shipments for the week were as follows: From the Bullion-Beck mine, 25 carloads ore; Centennial Eureka, 9; Gemini, 4; Ajax, 10; Utah, 4; Sioux, 5; Swansea, 4; South Swansea, 5; Sunbeam, 1; Buckeye, 1; Dragon Iron mine, 2 carloads ore daily.

IDAHO.

In the Campbell tunnel, in the Standard mine, in the Cœur d'Alenes, a strike has lately been made of what promises to be a large ore body.

Wood River *Times:* The indications are that an important quartz mining district will be opened up at the Cold Springs, six miles below this place. Several locations show good free gold ore on the surface, and the hanging walls are porphyry.

Spokesman-Review: In the Elk City country, one of the old placer camps which has been until two years ago practically deserted, the placers are attracting considerable attention, owing to the operations of the Idaho company, a syndicate of Chicago capitalists, who are operating the American Hill placers. The Buffalo Hill is also being worked by a syndicate of Butte men.

Silver City *Avalanche:* Feour & Gearhart have sold the Humboldt group of mines on Florida mountain to a company organized in Pittsburgh, Pa.

The following is the return reported for the month of August for the De Lamar Mining Company: Crushed during the month, 4357 tons of ore; bullion produced in the mill, $65,098; estimated value of ore shipped to smelters, $4300; miscellaneous revenue, $300; total product, $69,698; total expenses, $43,990; profit for the month, $25,708.

Articles of incorporation of the Independence Mining and Milling Company, Ketchum, have been filed. The capital stock is $500,000, all of which is subscribed.

Spokane *Chronicle:* The Tiger and Poorman mines at Burke are closed on account of the fire which burned out their mills last year. The mills at present are being rebuilt, but work will not be resumed upon the mines while the present prices for silver and lead continue.

A rich body of ore has recently been struck in the Mammoth mine.

The Helen and Frisco have a shaft down 400 feet below the tunnel level and extensive workings both ways from the shaft.

The Morning and You Like mines are producing large quantities of concentrating ore.

The Gold Hunter struck a fine body of ore and that property is looking better to-day than ever before in its history.

The Last Chance and Bunker Hill are both being operated, but it is doubtful if they can continue to run much longer.

MONTANA.

Butte *Miner:* Superintendent Josiah Gilbert of the Boston and Montana states that a rich 4-foot vein of ore has been struck in the Atlantic shaft.

The Drum Lummon is now being worked at a depth of 1800 feet and is producing well for the stockholders who bought it for a million dollars.

There is a report that the Broadway group of mines at Silver Star have been purchased by F. Aug. Heinze of Butte, and that he will start up the Broadway mine with a large force of men on Oct. 1.

Inter-Mountain: It is estimated that W. A. Clark has already shipped $100,000 worth of gold ore from the Mayflower mine since he purchased it a month ago for $150,000, and reliable mining experts estimate that there is at least $150,000 worth of ore in sight at the present time.

SOUTH DAKOTA.

Black Hills *Times:* The power drill on the Dacy shaft has been put in operation and the shaft is now 50 feet deep and will be sunk to the 150-foot level.

The Horseshoe Mining Company has encountered a fine ore shoot in their Troy shaft at a depth of 190 feet. It is presumably the lower ore contact, but this will not be determined until the shoot is passed through.

The owners of the Hailstorm property on Spruce gulch have resumed work on their vein at the point of original discovery and are now taking out ore worth from $50 to $80 per ton.

Supt. Franklin R. Carpenter has decided to resume operations in the Union shaft, sunk by him to develop the Emma and adjoining groups of claims situated on the siliceous ore belt.

The Harney Peak Tin Mining Company have had two men at work for some time prospecting for gold-bearing ore veins. They are working at present near Samelias and Golden Slipper properties at the northern end of the Harney Peak ground.

The upper ore contact recently discovered on the Tornado group has been opened at various points on the surface and its continuity proven for a distance of about 800 feet east and west and 400 feet north and south, and is evidently the same contact that is exposed in the Fannie shaft at the 80-foot level and in the Tornado workings.

Ore assaying $76 gold per ton has been discovered on the surface of the Golden Summit lode, situated on the Poorman divide.

The Highland Chief Mining Company have received all the machinery and castings for their new mill.

COLORADO.

Denver *Republican:* At Idaho Springs, on account of a big strike in the Sun and Moon property, the force has been materially increased. In extending the level at 160 feet a big body of galena ore commenced opening out and is now 3 feet in width. It is solid mineral and all smelting.

The Shafter mine has also increased its force. The shaft was recently sunk and large bodies of mineral were cut. Men are now at work developing these ore chutes.

Green Brothers, operating the Kinda mine on Fall river, have opened up a big body of low grade ore.

At Cripple Creek the Alice, on Raven hill, is being developed by Omaha people. The shaft is down 187 feet and at 200 feet new levels will be run. A pay body of ore has been blocked out, but the first object is to prove up the ground, and no effort is being made to produce.

The dead work done on the Union Gold properties for the past six weeks has put it ahead of the stopers again, and the new ore seems to guarantee steady production.

One of the principal ore buyers in camp says that so far this month the business of his sampler had been the best in its history, both the amount and value of the ore purchased having exceeded that handled in the banner month of last year, and that in spite of the fact that while there were but two smelters in the district last year there are now five large ones and any number of smaller concerns to divide up the business. Another feature is that the mines from which the ore is now being bought are nearly all new ones. The old customers of last year now produce in such quantities that they ship direct to the smelters, while the new and last opened have taken their places as patrons of the samplers.

Since taking hold of the Geneva, on Gold hill, Tutt & Penrose have done 490 feet of development. The fifth level is now approaching the ore chute, and a specimen from the working showed the first free gold yet found in the ground. Production has held at about fifty tons per week while the development was in progress, but now the outlook is good for a heavier yield.

The Bonanza King, drifting from a point 400 feet deep, where the vein was entered from the Midget crosscut, is in a fine body of sylvanite ore, but the management is adverse to giving out the details.

At Telluride the Nellie property, consisting of a group, has been sold by L. L. Davis to Denver people. The consideration was $75,000 cash. This group consists of two patented claims and a patch of thirty-five acres of placer ground. A large force of men will be put to work without delay and the mine made an extensive property at once.

In Gilpin county George W. Middleton has taken a lease and bond on the Columbus lode in Russell district, and a new plant of machinery is on the way.

President W. Brant of the Chase Consolidated Mining Company has been making arrangements for the starting up of their property, in Willis gulch.

From Aug. 14th to Sept. 1st there were shipped from the Black Hawk depot 212 cars of mineral, aggregating 3392 tons, to the Denver smelters and elsewhere, which represented the mineral output for the month of August; and though owing to the scarcity of coal, many of the properties did not produce their regular output, this shows an increase of six cars over the whole of the corresponding month of last year.

At Creede, Senator Abbott has struck a six-foot vein in the Holy Moses tunnel after driving within 25 feet of the distance of 1100, which the survey at the outset indicated would have to be driven.

In the Holy Cross district the Eastern capitalists, since commencement, have expended in development $70,000, the result of which is an 1100-foot tunnel on French mountain, on which the company owns 1000 acres of land. It is intended to drive the tunnel 3500 feet straight into the mountain, cutting the various veins which traverse it. In driving the 1100 feet 250,000 tons of ore have been blocked out, of an average value of $35 per ton. Various tests of the ore were made, and it was definitely ascertained that the best method of treatment was by the cyanide process. The company are now making arrangements to erect a 100-ton cyanide mill.

At Ward, Martin Bassen and G. Moutan have about completed a deal with S. B. Shaw of New York for the sale of the Bald Eagle mine.

A party of St. Louis men were in camp last week looking over the Humboldt and Humboldt Extension mines, with a view of purchasing.

Charles Davis is working about 85 men on his Victoria mine at Summerville, in drifting and stoping. This mine is a silver proposition and the ore now being taken out will run about 300 ounces in silver to the ton.

Watson & Sailor, who have a bond and lease on the Blue Bird, have completed their new shaft house and are sinking the shaft on the mine. A shipment of ore last week gave satisfactory results.

The Giles mill has closed down to allow extensive improvements to the plant. A new 60-horse power boiler is to be added to the equipment and a Corliss engine is to take the place of the two small engines now in use.

ARIZONA.

Journal-Miner: The Crowned King Mining Company has reduced its working force in the mine during the time it will take to sink the shaft and establish a station at the 400-foot level.

The Red Dog and Golden Star groups of mines in the Winifred district, north of Phœnix, are to be sold to Chicago people.

D. M. Riordan has bonded the mine on Cherry creek, Yavapai county, known as the Jesse R, belonging to F. A. Biffer and operated by Butler & Murphy.

Mining News: D. Sheedy and F. F. Struby, Denver capitalists, have bonded the property of Hull & Wingham, in Jerome, for $125,000, $50,000 to be paid on the 19th day of September, 1897, and $25,000 in three six months' payments. The group contains five claims—the Silent, Buncom, 99, Sunny South and Number One.

Assays from a 4-foot vein of copper ore lately uncovered in the St. Peter-Martin properties gave very satisfactory results.

CALIFORNIA STUMP PULLER.

This is a photograph of the Stump Puller at work on redwood stumps on the farm of C. E. Osburn, Guerneville, California.

In the improved form in which it is now offered to the public, it is universally admitted to be the most practical, powerful and successful machine of the kind in America, and the only machine in existence that can be successfully operated on hill land.

ONE KNOWLES VERTICAL SINKING PUMP.

Capacity, 12,000 gallons per hour; in perfect order. Will sell at half price. Address

P. ODERMATT, Boiler Works,
58 & 60 Bluxome Street, San Francisco.

FOR SALE.

One Gold King Amalgamator,

VERY LITTLE USED.

Now on store at S. P. Freight Depot, 4th and King Sts., S. F. Examine and make an offer to C. K. KING, 902 Broadway, Oakland, Cal.

A Position Wanted

By a Practical Mining and Mill Man, a party having had sixteen years of experience on the Comstock and fifteen years in California gold mining and milling and understands the practical mining and milling in every branch and detail. He is also a first-class accountant. The best of references given. No objection to going into foreign country, as the party speaks English, German, French, Spanish and Dutch.

Address "Practical Miner,"
Care of Mining and Scientific Press, S. F.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

SITUATION WANTED by an experienced amalgamator and millman who thoroughly understands his business. References furnished. Address ALEX. H. FORMAN, this office.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

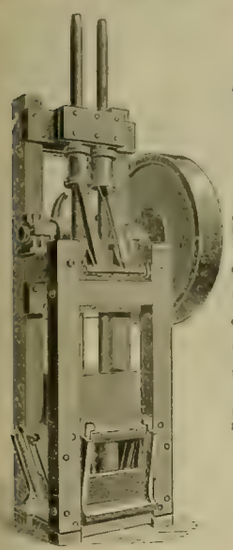
MINING AND MILLING MACHINERY.



"HENDY" IMPROVED
TRIPLE-DISCHARGE
Two Stamp Mills.

Superior to all other Mills of the same form for the following reasons:

First. Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.
Second. They are the cheapest mills to the stamp that were ever offered to miners.
Third. They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.
Fourth. They crush all kinds of ore, rock, cement or conglomerate perfectly.
Fifth. They are more durable, as the framework is secured to the mortar and thoroughly bolted together.
Sixth. The several parts are interchangeable and can be readily set up or taken down and duplicated.
Seventh. No skilled labor is required to assemble the parts.
Eighth. The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.

Weight of Stamps (each) . . . . . 850 pounds.
Weight of Mill complete . . . . . 7500 "
Power required to drive . . . . . 5 H. P.

CAPACITY, SIX TO TEN TONS PER DAY.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.
SECOND: The saving in millwright and mechanics' labor in framing and erecting.
THIRD: The large amount of space saved.
FOURTH: The great saving of freight,

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

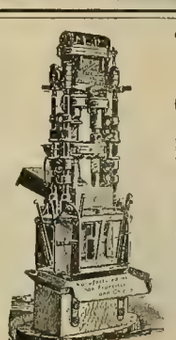
IMPROVED GOLD STAMP MILLS.

General Mining Machinery and Supplies.



Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight. About 5000 Pounds.

It requires no belting, shafting, pulleys or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

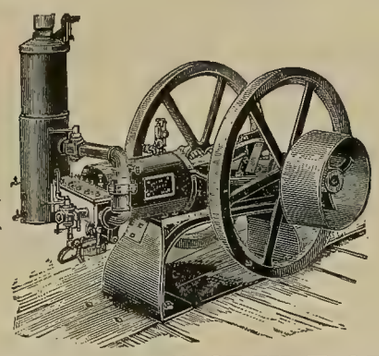
CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING



THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run. 1000 feet	$2 00
Gasoline (74 deg.). ten hours' run. 8¾ gallons @ 14c.	1 25
Coal Oil, ten hours' run. 7½ gallons @ 10c.	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c.	48
Crude Petroleum (36 deg.), paraffine base. 13 gallons @ 5c.	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

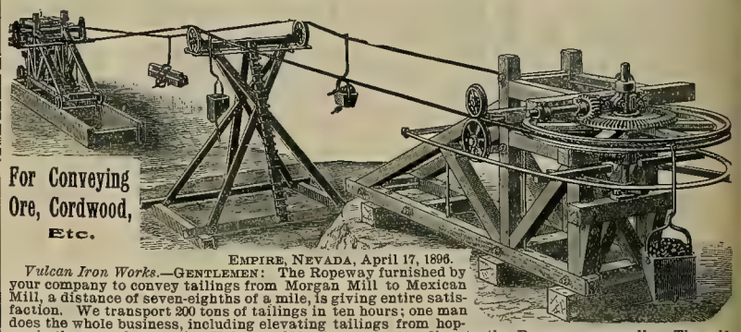
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

WHY THE SPRINGER CONCENTRATOR IS THE BEST.

It will do more and cleaner work than any Rubber belt machine.
It weighs only one-half as much as some of the other six-foot Concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any.
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer Concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other Concentrators.

SAN FRANCISCO, May 27, 1896.

I. S. Van Winkle & Co., 413 Market St.

DEAR SIRS:—In a letter just received from our Superintendent, Mr. Trowbridge, he says, referring to your Concentrator: "The new Springer Concentrator is fulfilling every expectation. A few minor points may be improved upon, but in its main features it is almost perfect. I shall write more fully after further work." Yours very truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

Extract from Letter of W. S. Trowbridge, Superintendent Bald Eagle Mining Co. June 20, 1896.

"We work twenty tons of ore per day and size out all coarse portion after it has been worked over two other machines, and run all the slimes and finer portions over your machine. I think it would easily handle twice the quantity. It is certainly doing splendid work now, in a difficult place. I believe the belt will wear indefinitely."

July 12, 1896.

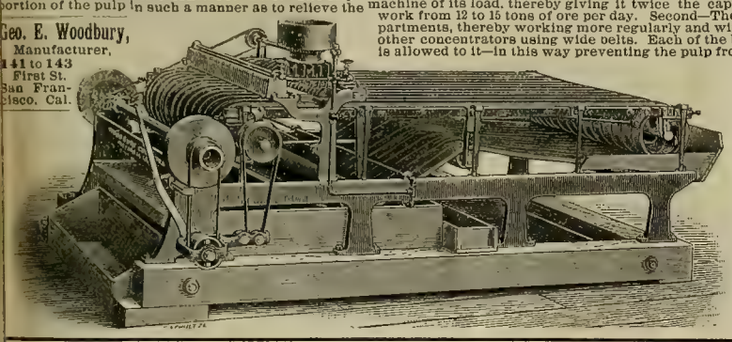
Ship us by steamer another six-foot Canvas Belt Springer Ore Concentrator and have the new Rubber Flange attachment, and put a rawhide belt on wheel. Yours truly, W. H. PAYSON,
Secretary Bald Eagle Mining Co.

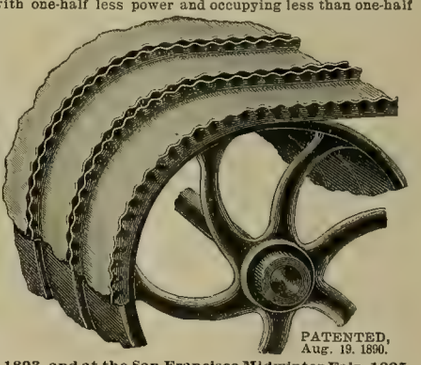
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st. prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 1, 1896.

Merchandise brokers continue to report an improving demand. Although this had been looked for, yet the volume of goods going out is in excess of estimates made thirty days ago. So far as we are able to learn the improvement extends to the agricultural sections as well as to the mining districts. The advance in the market value of wheat and a general lower range in inland freights are the inspiring factors which have brought about the better feeling. There is a growing belief that foundrymen, machinery manufacturers and ironworkers in general will soon begin to feel the invigorating effects of better times among the productive classes. If the advance in wheat is on legitimate and not on speculative lines, it is stated there will be quite a demand next year for farm machinery, which ought to cause the placing of considerable orders. It is reported that in view of better prospective times two or three of the large iron works have secured considerable iron for future delivery, fearing that prices might be advanced later on.

Confirmed advices that the Panama Railroad Company will expend a large sum of money—reported at about $1,000,000—for harbor and other improvements at the Isthmus, is accepted as a forerunner of an improved call for goods and material from that source. This ought to increase our trade in that direction.

In the local money market there is a continued growing ease, with no difficulty met in securing accommodations by those offering good to gilt-edge security. The bankers are disposed to give regular customers better accommodations, if desired by them. As a rule the demand for money is slow, owing to good collections and the commercial interests not having stocked up as large as has been their custom at this season of the year. Money continues to set this way from Australia, owing to exchange being favorable. There are more wheat bills offering, which shows that farmers have been selling on the advancing market. The output of the gold mines is largely in excess of last year's, which adds still more to the available supply of funds. At the East our New York advices are to the effect that the large trust companies are in the market as lenders at 6 per cent on three and six months' time. The banks there are giving better accommodations. The demand for funds at the East is said to be good for crop-moving purposes. There is still large offerings of commercial bills to meet heavier shipments of wheat, iron, rails, cotton goods, etc. These offerings indicate a continued flow of gold to this country, although advancing ocean freight rates may interfere with the free movement of products out of the country.

In Europe the money markets are working closer, with the rates of discount increasing, owing to the continued demand for gold. The premium on the latter is strengthening.

New York Silver Prices.

NEW YORK, Oct. 1.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	30 5-16	65⅝
Saturday	30 5-16	65⅝
Monday	30 5-16	65⅝
Tuesday	30 5-16	65⅝
Wednesday	30 5-16	65⅝
Thursday	30 5-16	65¾

	Copper.	Lead.	Iron.	Tin.
Friday	10 65	2 77½	10 25@12 50	12 90
Saturday	10 65	2 80	10 25@12 50	12 90
Monday	10 65	2 80	10 25@12 50	12 90
Tuesday	10 65	2 80	10 25@12 50	12 90
Wednesday	10 65	2 80	10 25@12 50	12 90

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	05
New York Telegraphic Transfer	10
London Bankers' 60 days	$4.83
London Merchants	$4.82
London Sight Bankers	$4.85
Refined Silver, peroz., 1000 fine	65¾
Mexican Dollars	51½@52½

SILVER.—The market has ruled dull but steady throughout the week. The steamer Doric for the Orient took out $174,900 in bullion. There is a slight improvement in the inquiry from this direction. The East reports a continued fair export movement, with considerable buying on speculation, but prices have not advanced. There is a growing belief, in usually well-informed circles, that there will soon be a better demand for silver; and as supplies are said to be well in hand, higher prices are apt to rule. So far as the writer can see, there is nothing as yet to warrant this belief unless those who predict it base their opinions on a demand from speculators and those who sold short to delivery all the way from thirty days to the close of the year. It is stated that considerable has been sold at 70 cents, and under seller 1896.

MEXICAN DOLLARS.—The market is quiet. The Doric took out for China 47,723 dollars. At the East a fair export movement is reported by our exchanges.

The market is quoted as follows:

Ingot, jobbing	—@13½
Ingot, wholesale	—@12½
Sheet copper	—@16½

LEAD.—The market holds steady on this coast, at the East and in Europe. At the East there has been more buying corroders owing to large increase in the call for mixed paints.

Our market is quoted as follows:

Pig	— @ 3 65
Bar	— @ 4 00
Sheet	— @ 5 25
Pipe	— @ 4 50

COPPER.—The market is quiet. The East reports a fair demand for home and a good export inquiry, with the latter usually at from ⅛ to ¼ cent below current quotations. Europe continues to report a large consumption, which is steadily decreasing stocks held abroad. While the European production of copper has increased only 523 tons for the first eight months of this year, our domestic production shows a gain of over 26,000 tons. Our exports of the metal have increased 33,579 tons, or over 7000 tons more than the increased production. The United States is today the world's base for copper supplies. Principal copper supplies of the world in long tons from 1879 to 1895:

	1895.	1894.	1890.	1882.	1879.
World	334.105	324.505	269.455	181.622	151.963

Principal source of supplies are:

U. S.	172.300	159.695	116.325	40.470	23.850
Spain	54.950	53.995	51.700	39.560	33.361
Chili	22.975	21.340	26.120	42.909	49.318
Average price:					
Chili bars.	£42 17s 6d	£40 2s 6d	£54 1s	£67 6s	£57 11s

ANTIMONY.—The demand is fair, with the market steady at 7⅞@8½c in a jobbing way. New York mail advices quote 7⅜ for Cookson's, 6⅝c for Hallett's and 6½c for Japanese, from store.

BORAX.—The movement Eastward continues quite free.

The market is quoted as follows:

Refined, in car lots	6½
Refined, in sacks	5⅞
Powdered, in car lots	5½
Concentrated, "	5⅝

QUICKSILVER.—The market is steady at quotations.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

SHOT.—The retail call is steadily enlarging.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

TIN.—The season's demand is over, which causes a dull market with quotations largely nominal.

Pig, per lb	13½
Plate, I C coke, heavy, per box	—@$4 05
" " light, "	—@ 3 95

POWDER.—The demand is exceptionally large at unchanged quotations.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
" No. 2, " "	8½c

IRON.—Our market is practically unchanged. The East reports an improving demand, but no advance in prices. Higher ocean freights are against free exporting. So far this year there have been shipped out of the country 50,000 tons of steel rails. Japan has been increasing her purchases in this country at the expense of Europe.

Our market is quoted as follows:

AMERICAN.	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00
ENGLISH.		
Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50

Bolt	¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing	20

COAL.—While quotations are given out unchanged, it is stated that sales of near-by, prompt shipment and future shipments have been made for less money. The advance in wheat charters is attracting more vessels with coal to this port. Domestic coals are easier. The consumption is steadily enlarging.

SPOT FROM YARD—PER TON.	
Wellington	$7 50@ 8 00
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 00@ 5 50
Coos Bay	—@ 4 50

Scotch Splint	—
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	—		— —
English, to load	8 00	@	— —
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	— —
Cumberland	— —	@	— —

LUMBER.—The demand is dull for home and fair for export.

Redwood, Fluming	17 00	@	— —
Pine	14 00	@	19 00
Spruce	26 00	@	31 00

NAILS.—The market is barely steady.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

Mining Share Market.

SAN FRANCISCO, Oct. 1, 1896.

The market has been dull and heavy the past week, with a gradual easing in prices up to Wednesday when a stronger tone set in along the whole line. On Tuesday Con. Virginia sold at $1.55, Chollar at $1.95 and Potosi at 68 cents. The rest of the market shaded off slightly in sympathy. The selling of Potosi down to 68 cents was due to the levying of a 25-cent assessment. The market continues to act as if it was a freeze-out game preliminary to an upmove. The money market is setting in favor of more ease, but this may not be pronounced until after the annual meetings of some of the leading banks. The scare of a money stringency is wearing off under accumulating funds in the banks and at the Sub-Treasury in this city and a big advance in prices for wheat. Notwithstanding this, there does not seem to be any speculative movements. Outsiders who gave considerable attention to mining shares have been attracted to wheat, owing to futures in this cereal having rapid fluctuations. Official letters from the mines do not give much encouragement to those who are drawn into operating in shares when there are lively fluctuations. While the letters are not of an encouraging character in this direction, still they report work under way in several mines which may lead up to ore strikes. The general scarcity of shares available for shorting by outsiders is in favor of manipulators who can do the selling at every favorable opportunity, but these have been few and far between. The low prices ruling for shares are also against outsiders selling short. Interest is still centered on the work on the Brunswick lode. While many look for a decided improvement in the 400-foot level of the Hale & Norcross-Chollar south drift over the 300-foot south drift, yet there are those who hold to the opinion that nothing big will be found. As yet, the work is not pushed with vigor. Why this is so, is one of the problems hard to solve. It may be the manipulators have not secured enough shares and are making slow progress in the hopes of tiring holders out. In the Bodies trading has been quiet also, with very little change in prices. While the market at this writing is against buyers, yet the general tone warrants the belief that a small move is near at hand; but before it comes prices may shade off a little more, to frighten holders into selling.

The news from the Comstock mines, as officially reported, is far from encouraging, but private advices, from seemingly reliable sources, are quite hopeful that better news will come to hand before long, probably after the freeze-out game is well through with. From the north-end group of mines the same old sing-song, stale advices come to hand through official sources; and as for that, the letters from the other groups do not show much, if any, variation. It would seem that a saving of money could be had by having a number of letters struck off and changing the dates and distances run from week to week. In Utah, Sierra Nevada, Union and Andes the work has not been changed in any essential feature. The managements do not appear anxious to push the work. This may be done on economical grounds so as not to let assessments come too often. In Mexican the north drift from the west crossdrift on the 1000-foot level was, at last advices, in porphyry, clay and quartz seams. In Ophir, on the 1000-foot level, the advices only mention work in the No. 2 west crossdrift, which was out 32 feet. Exploiting work is still being done on the old central tunnel level. Some low-grade ore is being found. Interest continues to be centered on Con. Virginia, owing to work being carried on on three levels, with considerable unexplored ground to be exploited. On the 1000-foot level it is to the west towards the Ophir and on the 1650-foot level to the east towards Best & Belcher. From the 1750-foot level ore is still being raised, but it is not in sufficient quantity or of high enough grade to cover current expenses. In Best & Belcher and Gould & Curry the east crossdrift from the 800-foot Bonner shaft level is being pushed slowly ahead. At last advices it was in about 160 feet. The Savage letter is unimportant. From Hale & Norcross the advices regarding the work on the 900-foot level is quite encouraging. The ore in the upraise was, at last advices, still improving. More ore is being extracted, having a market value of about $75 a ton. On the 1100-foot level they are running east and also preparing to raise on a streak of ore going $22 a ton market value. In Chollar and Potosi the news is practically the same as reported last week. In Bullion they are still running the north drift started 2170 feet in the west crossdrift. Alpha's official letter reports work continued on the 500-foot level. In Con. Imperial, west crossdrift No. 3 is still being pushed slowly ahead, as is the joint Challenge-Confidence-Con. Imperial west crossdrift. From Challenge and Confidence nothing new is reported. From Yellow Jacket no news is allowed to leak out about the work. In Crown Point, exploiting work is still under way on several levels. The low-grade ore that was milled just about covered expenses for extracting, milling and transportation. The gross yield of ore milled by Belcher gave a return of about $7700. The letters are still silent as to the work that is being done. From Seg. Belcher and Overman nothing new is at hand. The same remarks can be applied to advices received from Alta.

On the Brunswick lode our advices from Occidental are essentially unchanged. In Chollar they are still raising from the 200-foot level for surface connection. On the 300-foot level the south drift is still being pushed slowly ahead. On the Hale & Norcross 400-foot level the south drift has not reached the Chollar north line. Better news is expected before long. In the north drift on this level the ground continues soft and is of an encouraging character. In Savage work is continued on the 300-foot level. The work in Gould & Curry ought to attract more attention before long. In Best & Belcher and Con. Virginia they are still sinking the shaft.

From the Bodie district the news is about the same as heretofore reported. Considerable work is being done in each mine, with some ore raised and milled each week by the Standard, Bodie and Bullion.

The official letter from Silver King, Arizona, states that they are again in position to handle the water.

The following illustrates the changes of the week:

MINES.	Sept. 24.	Oct. 1.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY,
S. BAMBERGER, President and Manager,
SALT LAKE CITY, UTAH, October 10, 1895.

B. B. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO,
C. C. MCIVER, President; D. CUSHMAN, Secretary,
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

The Miners' Convention.

Secretary Sonntag of the California Miners' Association has sent out to the county organizations a call for the convention, in which he says:

"You will please take notice that the annual meeting of the California Miners' Association will be held in this city on Tuesday, November 10, 1896, under the constitution and by-laws adopted last year by the convention. It is necessary for the secretary of each county organization to forward to me two weeks previous to the holding of the convention, a list of delegates appointed. I would ask that this rule be observed so as to facilitate the work of this office, and shall expect the lists forwarded not later than the 27th of the present month.

"Arrangements will be made with the railroads for reduced rates of fare.

"There are many matters that will come before the convention that will be of the utmost importance to miners of the State, and it is hoped that each county organization will send a full and complete delegation."

In neither Amador nor Sierra counties are there local miners' associations, and the members of the executive committee of the State Association from those two counties have been asked to endeavor to form county associations. The convention badge this year will be of silver, representing Marshall.

There is talk among members of refusing to listen to the declination of the veteran, President Jacob H. Neff, to again become a candidate. Certainly the coming year promises to be very important in the history of the California Miners' Association, and much will depend upon the choice of an executive officer.

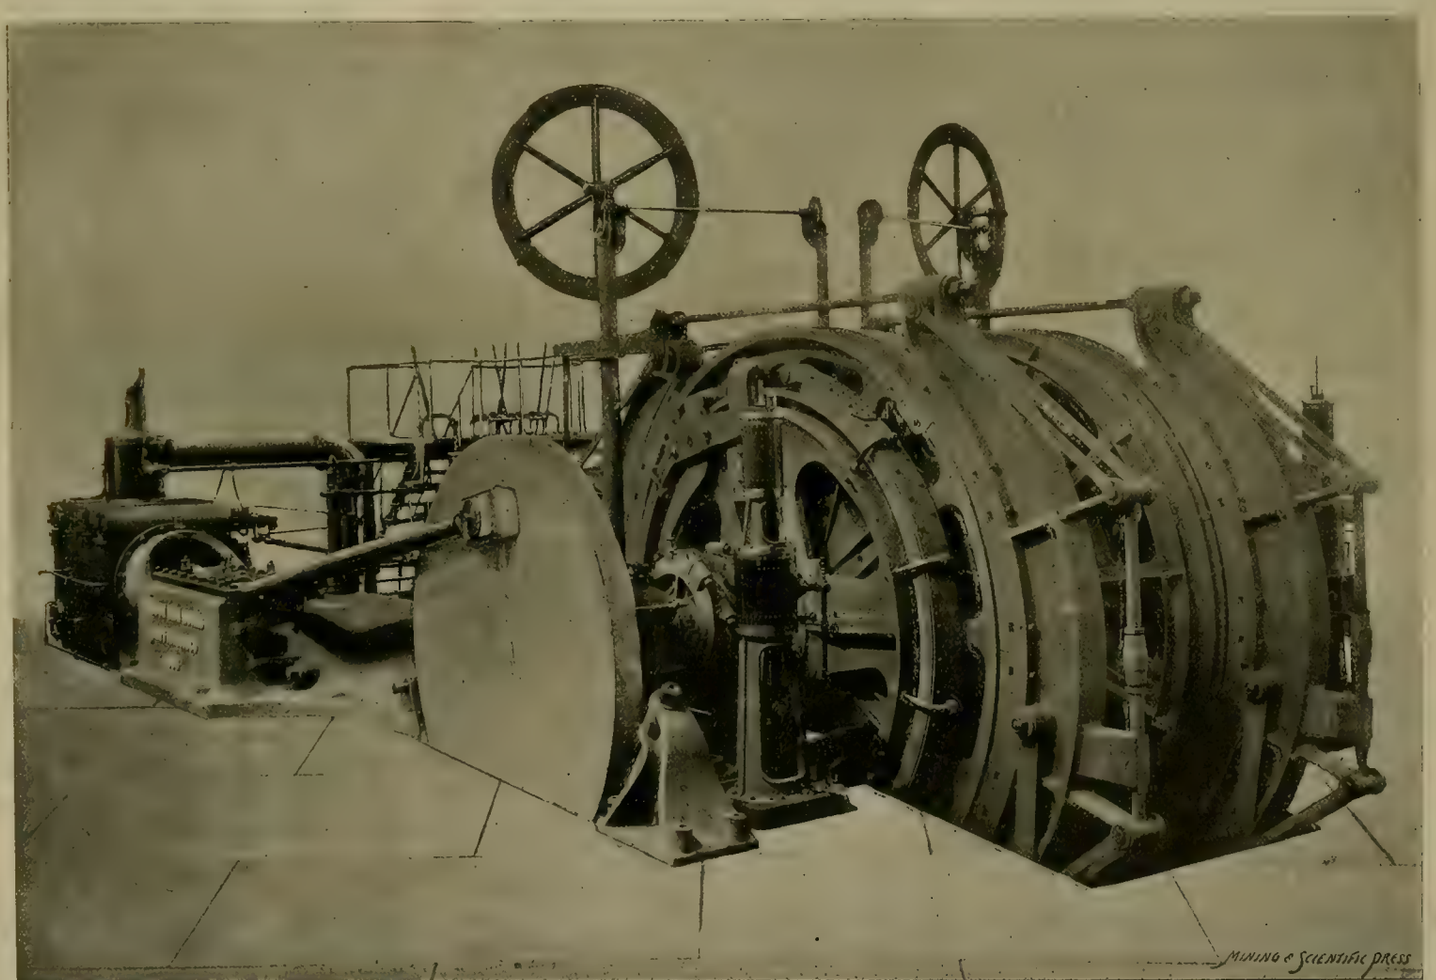
Many of the members seem to have gained an idea that as soon as the questions connected with the Land Department at Washington and the railroad land grants are settled there will not be much work for the association to do. But with the rapid growth of the industry there will be more need than ever for the good offices of such a representative body of men. There is needed legislation to be asked of the State Legislature and of Congress. As the industry grows its needs in these directions increase. Less attention is paid by the State to the industry in proportion to its importance than any others.

The Association can, if it will, do much toward securing proper support and intelligent direction to the State Mining Bureau and the School of Mines at the State University.

But the most important thing that can be done, and what would be of the most lasting benefit, would be to secure the establishment of a department of mines in the Federal Government. The Northwest Mining Association during the past week has taken up this question at its first annual convention. No doubt other mining bodies will do likewise, and there is every promise of concerted effort on the part of all the miners of the country.

Hoisting Engine for Anaconda.

A large amount of heavy mining machinery continues to go out of California. This is due mainly to the good progressive work being done by the manufactures. On this page we illustrate a new hoisting engine recently placed in the Anaconda copper mine in Montana, which are being purchased by the Exploration Company of London for over thirty million dollars. This is one the largest engines of the kind in the country, the cylinders being 30x72, suitable for 125 pounds working pressure. As will be seen by the cut, flat rope is used, and all the operating parts are controlled by separate engines. The engine was built and finished by the Risdon Iron and Locomotive Works of this city, within four months from the date of the receipt of contract. It was delivered in Butte last week and placed in position.



HOISTING ENGINE BUILT IN THIS CITY FOR THE ANACONDA MINE.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hoisting Engine Built in This City for the Anaconda Mine, 293. Galvanometer; Dynamo Used in Electrical Instruction, 299.

EDITORIAL.—The Miners' Convention; Hoisting Engine for Anaconda, 293. Moneys Collected From Mining Incorporations for the Mining Bureau; Increase of Voters in the Mining Counties; Money Expended on So-called Development Work; California Experts Abroad; A Mining Bureau Bulletin; Mining Progress, 294

ELECTRICAL PROGRESS.—Electric Mining; Electricity and Rifle Practice; Electric Farming, 299.

SCIENTIFIC PROGRESS.—Electricity Taught by Correspondence; Aluminum Bronze and Its Uses in the Arts; How Violet Rays of Sunlight Act upon Moist, Organic Matter; Treatment of Ramie, 299.

MECHANICAL PROGRESS.—Accumulation of Waste Glass; A Competitor in Pig Iron; Horseless Carriages; Feathers in a Bicycle Tire, 300.

PRACTICAL INFORMATION.—Western Real Estate and Building; Population of the Globe; New Metals for Coins; Electric Road Between Chicago, St. Paul and Minneapolis, 300.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 302–3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 310.

MISCELLANEOUS.—Concentrates, 295. Gold Mining in California; Gold in the Guyanas, 296. Gold in Granite and Plutonic Rocks, A Cheap Cyanide Plant, 297. How to Frame a Report, 298. Coast Industrial Notes; Recent Patents; Books Received; Recently Declared Mining Dividends; Recent California Mining Incorporations; Personal, 301.

IN THE valuable article on the "Gates' Canvas Plant," by W. S. Hutchinson, published in our last issue, the scales of the sketches were given incorrectly. They should be: for Fig. 1, scale ¼-inch to 1 foot; Fig. 2, scale $\frac{3}{32}$-inch to 1 foot; Fig. 3, scale ½-inch to 1 foot.

IN the act establishing the State Mining Bureau, it is provided that it shall be the duty of the tax collectors in the several counties in the State and of the license collector of San Francisco to transmit to the State treasurer, for the Mining Bureau fund, all moneys collected by them from mining corporations or from corporations formed for milling ores or for supplying water for mining purposes, under the act imposing a tax of 10 cents on the issuance of each certificate of stock of corporations. Except as to San Francisco, this law has never been enforced. Estimates have been made which show that if it were enforced, enough money would be collected to maintain the Bureau. It is understood that the Governor proposes to take steps to have the law enforced.

THE number of voters registered in Nevada county this year is 20 per cent more than that of 1894. There has been even a larger increase in Shasta county. In all the mining counties, in fact, the increase in registration over that of 1894 is far out of proportion to any previous increase in any part of California for the last thirty years. There has been no large immigration into California to cause this filling up of the mining districts and it is not probable that it indicates a large increase in the total population of the State. The mining districts have drawn principally from other parts of the State and have given employment at wages higher than those paid in any other parts of California. The large increase of population in these counties has not caused any complaint of hard times nor of the presence of large numbers of unemployed.

A LARGE PROPORTION of the money being expended in California upon so-called development work is wasted. This is especially true of smaller mines, where the owners sink many shallow shafts or run short tunnels, that do not any more than prove the presence of good prospects. They do little to show up the extent and value of ore bodies. This is one of the relics of the vicious system of earlier quartz mining in this State, when it was supposed that mines along the mother lode would not pay in depth. Taking the mines in this State that have been big producers, nine times out of ten we will find that they are mines that have been abandoned after a lot of money has been wasted in "gophering" on the surface. Capitalists later took hold of these same prospects, and, by working them properly, developed good mines. The cost of sinking several shallow shafts or running short tunnels often amounts to more than enough to sink one deep shaft that will develop large ore bodies; and not only that, but be of permanent use in working the mine. Yet it sometimes happens that the mine owner is wise in not sinking very deep. He knows the old maxim that many a rich prospect has been ruined by developing it.

California Experts Abroad.

The London *Mining Journal*, in an editorial entitled "English and Foreign Mining Experts," speaks of the rapid replacement in late years of English mining engineers by foreigners, and especially Californians. A few years ago the financier in London who had taken up the exploitation of a mineral property would apply to an English firm of experts, and would secure the services of an accredited English engineer to report upon its prospects and value. When a company was formed to carry on the working of the mine the technical staff would be drawn mainly from Cornwall, and technical supervision and advice would be sought from the firm in London originally consulted. Now the *Mining Journal* says:

Since the development of the South African gold fields, however, it must be admitted that the glory of the English mining expert has, to a considerable degree, departed. It is a confession which we make with considerable reluctance, but which, at the same time, in the interests of the mining profession, it seems desirable to make. The financial creators of the Rand were mainly men of experience on the Kimberley diamond fields, and there American mining methods and men had already been appealed to with some success. They complained that Englishmen did not adapt themselves to the strange conditions of working on the Witwatersrand. The college-taught expert was declared to be a compound of British pedantry and German scholasticism, with little or no practical experience and an unintelligent reliance upon inapplicable text-books. The Cornish "captain" was scarcely an improvement. He understood mining practically enough, but it was only as it is understood in Cornwall. * * * * *

It is true that there were numerous exceptions to these strictures. Some of the most successful mines on the Rand have been developed by consulting engineers who came straight from the English technical institutions, or by managers who had learned everything they knew in Cornish tin mines. At the same time it is impossible to shut one's eyes to the fact that there has been, as a whole, a tendency in South Africa to supplant Englishmen as engineers and managers by Americans and Germans. At the present time the most brilliant advisory positions in both the Transvaal and Rhodesia are held by men whose training ground has been California, and managerships are increasingly coming into the hands of their countrymen. A young Englishman with the highest testimonials who goes out to Johannesburg will find considerable difficulty in obtaining a responsible position at a mine of which the directorate is almost entirely English, and the capital of which has been entirely obtained from England. In Western Australia, the same tendency is exhibiting itself with even greater force.

That this is a regretable state of affairs even the most dividend-absorbed mining shareholders will admit. To give the the technical administration of our mines to Americans and Germans is to render it almost certain that the majority of the orders for machinery and other supplies will go to the United States and Germany. As a matter of fact, this result has already largely happened from the growth of the foreign element in mining centers exploited by British capital. There is no need to assign reasons of personal interest to account for such a displacement of trade. A man who has learned mining in California is almost certain to go for the appliances of mining to the sources from which California obtains them. So far as shareholders are directly concerned, the evil of this foreign pre-eminence lies in the inferior *morale* of foreign to English experts. Speaking broadly, we may say that the mining engineer who has been educated in this country looks upon himself as the servant of the shareholders; an American or German is frequently avowedly the employee of a certain group of financiers. In principle, at all events, we cannot say that we admire the system of appointing a man the salaried servant of a private firm or a limited company whose business it is to dispose at a profit of the properties upon which he reports. It is a nice point whether the Californian or German engineers really possess the superior qualifications in regard to technical knowledge with which the mining community in South Africa and Western Australia appears to be ready to credit them. As a rule, the foreigner is more pretentious, and his abilities and knowledge are often less solid than those of an English rival who impresses a financier much less strongly. Many a smart Yankee has of late, since the outburst of favoritism for American engineers, acquired a share in the management of an important mine worked by English capital merely on the strength of a short residence in a Californian mining camp. Moreover, the supply of genuine Californian mining experts is somewhat limited, and many of the Yankees who have recently been imported into the Rand and Coolgardie are the immediate emanations of an Eastern university. They possess even smaller practical knowledge than the discredited Englishman.

It is, however, probable—and we think most experienced English mining engineers will agree with the opinion—that the teaching in English technical institutions is a good deal more inelastic and unpractical than in the corresponding places of the United States and the Continent.

It is true that the education of the English technical schools is less elastic than ours, but that does not give the Californian so much advantage. The success of the Californians has been due more to elasticity of their ability than their education. A Californian can adapt himself to new circumstances and take up new and comparatively unfamiliar work far better than his more conservative brother from England. The Californian appreciates the fact that the main value in an education is not that by it he learns how to do things, but to find out anything he may want to know. He is self-reliant, but at the same time will not hesitate to gather information from others. He relies more on his natural talent and ingenuity than upon hard and fast rules he has learned in schools or under circumstances different from those in which he finds himself.

A Mining Bureau Bulletin.

The State Mining Bureau has just issued an important bulletin entitled "A Bibliography Relating to the Geology, Paleontology and Mineral Resources of California," compiled by Captain Anthony W. Vodges, U. S. A. The literature relating to the mineral resources of California is widely scattered and to a great extent inaccessible to any but the specialists. Much of this literature would be made use of by those interested if they had any idea of its existence. A great many books and articles in various publications have been issued concerning California that are unknown except to a few. There are many articles incorporated in official publications of the United States and of the State of California, in magazines and in publications of the State University whose very existence is almost unknown to the general reader. Mining men are continually inquiring for publications on special subjects. This bulletin will, to a certain extent, supply that want.

It is remarkable the amount that has been written about California. Captain Vogdes' bulletin is a pamphlet of over a hundred pages, and to each book, pamphlet or article published there is devoted but a few lines.

We would suggest to the Mining Bureau that it continue the good work thus inaugurated by publishing a bulletin giving the bibliography of metallurgy, mining and other works wherever published that would be of value to the miners. The PRESS is so constantly in receipt of requests for the names of the best books on special subjects connected with mining, that we believe that such a publication would be heartily welcomed.

Mining Progress.

In no other industry are modern inventions more quickly taken up and pushed to the front than in mining. Much has been said in the PRESS of the good that has been done by the mining industry in settling up of the West. Much might also be said of what mining has done for science in a practical way through what was learned in the hydraulic mining operations of this State.

The old laws as to the flow of water and canals have been entirely discarded and the literature on that subject entirely rewritten. The construction of pumping machinery has been brought to the highest point, and far more through mining than anything else. Mining has done more in a practical way for the introduction of electricity for generating and transmitting power. As a matter of fact, it has given an impetus to all kinds of inventions, and a greater impetus than any other industry can give, because the rewards are larger. In a broader way, it has stirred up research in chemistry, metallurgy and geology.

Concentrates.

A NUMBER of miners from Grass Valley have gone up to the mines of southern Oregon.

IT is reported that Charles D. Lane has purchased the La Grand Oro property near Carson, Nevada.

THE Mountain Chief mine in Willow valley, Nevada county, has been bonded and will soon be reopened.

A MEETING was lately held in New York to take steps toward the formation of a new mining exchange.

THE Union Hill Mining Company have decided to erect a 200-stamp mill on their property in the Black Hills.

THE Morning Star Mining Company of Iowa Hill has declared its seventieth dividend, amounting to $4 per share.

PROSPECTORS last Wednesday filed notices of location of cinnabar mining claims on the Presidio reservation in this city.

A QUARTZ VEIN that promises well has been discovered in the bedrock of the Sailor gravel mine in Sailor canyon, Placer county.

SOME discoveries made of quartz near the old Buchanan mine, in Tuolumne county, are causing considerable excitement.

THE Great Register of Nevada county contains this year 5,309 names against 4,410 in 1894, an increase of 859 or nearly 20 per cent.

DRY WASHERS near Randsburg, Kern county, are reported to be taking out as high as two and three ounces of gold per day to the machine.

IN southern Oregon there is considerable activity in gravel mining, and a number of ditches are being dug for hydraulicking on large scales.

AT Leadville the managers of the larger mines are completing preparations to resume work with laborers imported largely from Missouri.

A MINING COMPANY, in which Missouri parties are interested, has been incorporated in Elko county, Nevada, with a capital stock of $10,000,000.

THE successful working of the smelting plant of the Mountain Mines Company at Keswick, Shasta county, is stimulating the opening of mines in that county.

THE returns of shipments of bullion, matte and ore from the mines and smelters of the southern Kootenay since the beginning of the year show a value of $2,437,506.

IT is again reported that the Slocan Star mine of British Columbia has been bonded—this time for $2,500,000. Within the past 18 months it has paid $250,000 in dividends.

MONTANA and Missouri capitalists are making arrangements to work the marble quarries near Springville, in Utah, in order to determine the value and quality of the deposits.

THE British Columbia Southern railway will apply at the next session of Parliament for a Dominion charter, and for authority to extend its railway through Crow's Nest Pass to Alberta.

THE total dividends of some Utah mines to date are as follows: Ontario, $13,295,000; Bullion Beck and Champion, $2,075,000; Silver King, $750,000; Mammoth, $1,090,000; Galena, $45,000; Utah, $149,500.

ACCORDING to the Black Hills *Times* there is a body of uranium ore exposed in a group of claims near Portland camp. A large porphyry dike runs through the claims, in connection with which the ore is found.

IN the Randsburg district, in Kern county, the owners of the Rand mine propose to erect a 40-stamp mill. It was supposed that the water question would be very troublesome in that district, but the sinking of wells has shown that considerable may be obtained.

OWING to the good work that has been done for several years past by the California State Miners' Association, several of the mining counties which have hitherto given it lukewarm support are now forming local organizations and beginning to show a commendable interest.

AUSTRALIA is far from well supplied with water in many of the principal mining districts. Sir John Forrest proposes to build a huge reservoir somewhere in the Darling mountains, capable of holding 5,000,000,000 gallons of water, to be conveyed in pipes through Southern Cross to Coolgardie, a distance of something over 300 miles.

AN indication of the mining boom in New Zealand is the fact that the Brokers' Association, which two years ago was glad to receive new members at £100, now demands £500 for admission, and refuses many applicants. Then the *Mining Standard* asks for the establishment of a mint at Auckland. There are already mints in New South Wales and Victoria.

THERE is more mining on the bars along the American river in Placer county than there has been for many years. There are several strings of sluices above the Rattlesnake bridge, at Horseshoe Bar, Doton's Bar and other points down the river. Several places along Miner's ravine are being opened up and will be worked during the coming winter.

THE business men of Ensenada have sent on a petition to the Mexican Government to have crude petroleum placed on the free list so far as Cedros island is concerned. There are extensive deposits of low-grade gold ores there which cannot be worked without the very cheapest of fuel, as there is no water power available. Hence they want crude oil from Los Angeles for making steam.

THERE is probably no other kind of metal deposit more eagerly sought after at the present time, more profitably worked or more permanent and reliable than a large deposit of copper ore in a primary formation, says the Butte *Miner*. In fact, practical experience teaches that such deposits rarely ever dig out within the depth limits at which mining operations may be successfully carried on.

IT is understood that the Exploration Company of London, to whom the Mariposa grant has been offered, are about to make an examination of the property. The grant comprises over 40,000 acres in Mariposa county, and within its borders there is without question a great deal of valuable mineral. Several mines on the grant have in the past paid well, but altogether the tract has been but slightly prospected.

QUARTZ MINING is coming rapidly to the front in southern Oregon, and the number of ledges which are being successfully worked refutes the theory that this country contains only surface or pocket ledges, says the *Democratic Times*. Deep mining is the salvation of any mineral country, and the time will ultimately come when southern Oregon will be the scene of some of the largest mining operations in the country.

J. A. CORAM of Lowell, Mass., one of the directors of the Merced Gold Mining Company at Coulterville, announces that it is their intention to begin soon the erection of the proposed electric plant for supplying the miners with power and light. It is proposed to take water from the Mokelumne river, bringing it by pipe eleven miles, and it is expected that they will be able to generate electricity enough to obtain 8000 or 10,000 horse power.

DURING the alteration of the smelter at Nelson it was necessary to take out the bosh and bottom of the blast furnace, says the Rossland *Miner*. The bottom of the furnace was of fire brick and the bricks were thoroughly saturated with copper, silver and gold. The mortar, or fire clay joints, had been completely eaten away and replaced by copper and silver. The mass, which weighed several tons, was estimated to be worth about $12,000, and required a great deal of hard labor to break up on account of its toughness.

THE question of economy in hoisting plants is one which will enter more largely into the calculations of Butte mine owners and lessees in the future than it has in the past, says the *Inter-Mountain*. With the big mining companies steam power will probably always be preferred, but there are thousands of smaller mines in this district where the character of the ore will not justify the expense of even a moderate sized steam plant. It is in the latter field that many believe the introduction of electrical machinery will yet work wonders.

THE United States lighthouse tender Mary Anita has returned from Alaska, where she went with Captain Gailliard of the United States Engineer Corps, twenty-five workmen and a quantity of material. They proceeded directly to Portland canal, which is a body of water extending about eighty miles inland, on the boundary between British Columbia and Alaska. The trip is a forerunner of others next season, and its purpose was to prepare a base of supplies for the parties which would be sent out by the Government to locate the boundary line between these two countries.

WE have been so accustomed this season to hear nothing but curses for the Cook's Inlet country that it is a positive pleasure to meet one person who has at least made his exsenses, to know there are quite a few others who have done equally as well, and that probably a dozen out of the 2000 who flocked to the Inlet this spring will clean up a comfortable stake in the fall as a result of their summer's work, says the Alaska *News*. It has long been known that 99 out of 100 of these alleged miners knew absolutely nothing of placer mining, and that the country in general would have to bear the brunt of their ignorance.

THE new law imposing a tax upon the net output of the mines has done more, perhaps, to demonstrate the importance of the industry in Utah than all other influences combined, says the Salt Lake *Tribune*. It has forced the managers of close corporations to divulge figures that have been hitherto jealously withheld from press and public, and in the record now in the offices of the Board of Equalization is to be found an index to some of the greatest bonanzas ever developed in the West. Not only does it afford information concerning the net output of the property, but also the cost of treatment, of transportation, and of every item of expense that is involved in the production of a ton of ore.

A LAND CONTEST as to the ownership of the properties including the old Guadalupe quicksilver mine, in Santa Clara county, is before the Land Office in this city. In the early '70s quicksilver ore was discovered in that locality, and the lands were surveyed for the Guadalupe Quicksilver Mining Company, which operated very extensively from 1875 to 1894, taking out a large amount of valuable ore. Since that time the mine has not been operated. Meanwhile the Commissioner of Lands permitted homesteaders to file homesteads on the claim, because the quicksilver company had not carried its claim into an application for a patent. As soon as the homesteaders filed and commenced to improve, the mining company filed an application for a patent. The Commissioner then ordered this hearing, in order to determine whether the land is really mineral, in which event the mineral patent would probably be granted to the exclusion of the homesteaders, or whether it is agricultural, as the latter contend.

THERE are not many good old-fashioned swindles based on California mines put upon credulous investors in the money centers of the world nowadays. The reason for this is not hard to find. Means for gathering information about mining properties in any of the older mining districts are plentiful. The swindler prefers to deal in mines in the new districts, in order to cover his tracks. That is why he goes to the newer mining fields to get a few barren locations for a basis for a brilliant prospectus. He is turning his attention to British Columbia considerably of late, but there he is meeting with a reception that will hardly give him much encouragement. They are a very earnest, honest set—the miners of British Columbia—made up of men from Canada and the United States, who, like all honest miners, give little encouragement to shams and humbugs. This is best shown by the papers published in that new section of the Northwest. There is hardly an issue of any of our exchanges from all that country that does not contain words of warning in this direction.

SOUTH AFRICA threatens to become overrun with coolies from India. The South African *Mining Journal* says on this subject: "At last, and not before it was needed, there seems to be a prospect that some sort of effort is to be made to restrict the tide of Asiatic immigration into South Africa. As regards the Cape, the Colonial Secretary, speaking lately at a meeting at Graaf-Reinet, said that the great influx of coolies into the country must be stopped. They could not longer throw open their doors to such vast hordes of Asiatics. The Premier, he said, had promised to look into the question, and it would be dealt with next session. Unluckily, the Imperial Government has the view that coolies, being British subjects, are at liberty to immigrate to any part of the Queen's dominions, and that same view has caused their multiplication here to an extent which, while it may not yet have become an overwhelming danger to the white trader, threatens to become so. They make their way here from Natal, which is the sinner in introducing them. That they are already found undesirable, even in far inland centers, would appear from the action lately taken in the Kimberley Borough Council, when an Indian who had purchased a municipal building lot found the sale cancelled on a matter, no great one, of non-compliance with regulations, the Council evidently desiring to stop the nuisance of having Indians living among the white population."

ACCORDING to the Spokane *Chronicle*, there is a railway deal on foot for building from the Northern Pacific up into the new mining districts of British Columbia. There are a number of projects under consideration to tap this vast and rich district, which is now without means of transportation. The Canadian Pacific has already run several preliminary surveys into that section, and is only delaying construction of a road awaiting its accustomed subsidy and land grant from the Canadian Government. August Heintze has lately returned from London, where he went for the purpose of raising money for building a road into this northern El Dorado. The attraction which draws the attention of all these railroad magnates is the products of the mines—refractory ores that must be carried to the smelters. This is another example, if any be needed, to show what a few mines can do towards opening up any unsettled country. In a few years the agricultural and other resources of that country will be developed. They will be developed, in fact, a quarter of a century sooner than they would have been but for the opening up of the mines.

THE best evidence of what it costs to produce an ounce of silver from the mines of Utah during the year ending June 10, 1896, is afforded in the returns of various diggings now on file in the office of Assessor Lynch, as required under the law, which imposes a tax upon the net output of the mine, says the Salt Lake *Tribune*. These returns are accompanied by affidavits in support of their accuracy. Among the biggest surprises contained in the stack of returns is that which comes from the Old Jordan and Galena, that in the production of nearly 20,000 tons of ore sustained a loss of over $13,000. The superintendence of the property alone involved an expenditure of over $13,000. The Phœnix Mining Company produced 632 tons of ore during the year at an actual cost of $9,000, which also shows a loss to the producer. The Lexington, whose earnings have for years been going across the waters to fill the Parisian's pocket, has sustained another big loss during the year, although A. Lavignino approximates the net output at $15,000. The Maxfield Mining Company through its manager reports the production of 100 tons of ore of a gross valuation of $6000. To obtain this the affiant says about $14,000 was expended. While one mine has netted its owner a few dollars, scores have dragged their owners into debt, while many have planted their money in holes in which it can never sprout. In the struggle to recover it, the returns show that the miner has made shipments upon which the profit was but 56 cents a ton, and that these lots were very rare. Putting the returns that have been made together, the showing is anything but a gratifying one.

THE native laborer in the South African mines does not go on strike. Wages are low, but if there appears at any time a scarcity of "boys," as they are called, and a likelihood of a demand that would raise wages, more "boys" are imported from the wilds. In a late issue the South African *Mining Journal* says: "After long and careful discussion by all the men who whether by their acquaintance with the financial aspects of the matter or by their practical mining experience with large numbers of boys, and by their knowledge of the country are most competent to form and to draw up the actual working form required, the great scheme for the reduction of native wages, by which an immense pecuniary benefit should immediately result to the mines, has been definitely put into shape, and will come into force on the first day of October." The committee appointed by the several mining associations reported—"first, that the present rate of wages shall be reduced; second, that the reduction shall be effected on the basis of the maximum rates of pay; that provision be made for a periodical examination of the companies' books by a duly qualified accountant, in order that the above mentioned scale may be adhered to; third, that the reduction shall take place from the first of October next; fourth, that a uniform method of conducting compounds is desirable, and that all details with regard to food, length of shifts, etc., be left in the hands of the Association of Mine Managers. Your committee has informed the Government of the proposed movement for a reduction in the rate of native pay, and has asked for its cooperation in the matter. Your committee suggests the advisability of all managers of companies joining the Association of Mine Managers. In conclusion, your committee urges the necessity of action in the matter of the reduction in native wages, this course being essential to the success of the movement."

THE New York correspondent of the London *Mining Journal* gives a list of American mines reported by the press as sold since the first of this year, showing that $5,799,558 was invested by American purchasers and $1,695,000 by British and French capitalists. He goes on to say: "It must not be supposed that the sales I have above noted represent even the major portion of the business actually transacted this year. Very many other sales have been reported in the public press since the 1st of January; and in the very newspapers from which I took the information here presented numerous additional purchases of mines were mentioned without the prices being set forth. Moreover, the total does not include any reference to the joint stock companies that have been formed in America during the present year for acquiring and working mining properties. These corporations are literally numbered by the thousand, and represent an actual cash capital of certainly more than $10,000,000. Altogether, it seems to me probable that American capitalists and investors have contributed upwards of $20,000,000 during the past eight months for the working of mines in the United States. In addition to what I have here mentioned, several enterprises of very great magnitude are on foot. The famous Anaconda purchase represents a huge sum, and is about to lead to a great development of the copper industry. W. P. Tarbutt and Edmund Davis, of your city, are said to have agreed to contribute $1,000,000 to the Crocker-Poniatowski enterprise of opening up some thirty or more hitherto undeveloped mines on the mother lode in Calaveras county, California, and working the same by means of electric power generated at a station up in the Sierra Nevada, where an ample supply of water with a 2000 feet head is available. Your 'Exploration Company,' of Rothschild's fame, is credited with intending to do great things in southern Oregon, where it has just purchased the Lucky Boy group of claims in the Blue River mining district, near Eugene city."

Gold Mining in California.

NUMBER III—CONCLUDED.

By AUG. J. BOWIE, Mining Engineer.

The cyanide process has come to the assistance of miners in working certain classes of gold ore, not certainly, as a new invention, as the chemical properties of cyanide of potash have been known for years and the cyanide used and patents taken out in different parts of the world* before the Mac Arthur-Forrest process was known. The economical manufacture of cyanide of potash has permitted its successful introduction under certain conditions.

The tailings from most of the gold mills in California and Dakota run so low in gold that it does not pay to concentrate them, and, in many other instances where the concentrates are made the quantity is so limited that it is more economical for the miners to sell this product to a smelter or chlorination works, than to erect a plant for his own use.

The Yield of the Transvaal Mines.—The annual report of the State mining engineer of the Transvaal (Mr. Klumke) for 1895 shows that the total yield of the Transvaal gold fields from 1884 to 1895, both years included—twelve years—was 9,749,110 ozs. of gold, aggregating £33,500,000.

The gross yields of the Transvaal for 1895 was £8,569,555, which, at $4.84 to the pound sterling, equals $41,476,646.20.

The Witwatersrand fields produced £7,693,691, or $37,233,464.54, or 89.77% of the total yield of the country. At the end of 1895 there were in force in those fields 92,305 prospecting and 3283 digging licenses.

The total tons crushed aggregated for 1895, 3,903,333, or 68.8% per cent of the total yield of the Transvaal, showing an average yield of $7.31 per ton in the mills. During the corresponding period 3,015,986 tons of tailings were treated by the cyanide process, being 26% of the gross yield, or $3.57 per ton; and 193,256 tons (4.48% of the yield) of concentrates were worked by other processes, producing $9.58 per ton treated.

It is reported that at the present date over 3000 stamps are at work in the Rand district. The gold production is large, but nothing wonderful, for California, which, as late as 1861, was producing over $41,000,000 in gold annually.

The benefits derived from the knowledge and experience gained in California have been applied in South Africa under exceptional circumstances, assisted by cheap labor ($12 to $15 per month), and the results obtained have been satisfactory to the owners of the mines.

Financial papers abroad report estimates of the probable yield of the Rand mines to the 2000-foot level for a distance of ten miles. Long experience in mining has proven the futility of any such conjectures. If the estimates of the yield of the Consolidated Virginia and California mines during the last bonanza days, where only a few hundred feet in length and depth were figured on, are compared to those reported of the Rand, one must be struck by the similarity of the gross sums stated in both cases to be obtainable, and the fate of the Comstock's visionary yield should act as a warning to all investors.

The total yield of the Comstock lode from 1859 to 1891, inclusive, was as follows:

Gold	$140,771,979 28
Silver (calculated at $1 29 per oz.)	197,674,649 69
Total	$388,446,628 97
From tailings, 1871–89	$ 12,709,039 71

Australasia and United States of America.—From data obtained from the *Mineral Industry*, it appears that the total output of gold from Australasia from 1851 to 1891, inclusive, was $1,690,137,137, and from the United States from 1792 to 1848 about $24,000,000; but from 1792 to 1892, inclusive, the returns were:

Gold	$1,969,692,942
Silver	1,158,831,896

Placer Mining.—Passing from the field of quartz mining to that of placer mining, official estimates of the amount of workable gold deposits along the rivers of the principal hydraulic regions, lead one to infer that the quantity is practically unlimited, but a comparatively small portion of the whole only is regarded as workable under existing conditions.

It is generally accepted that these deposits have been laid down by the action of a system of tertiary rivers, the waters of these rivers eroding the auriferous slates with the included quartz veins and concentrating the precious metals in deposits which, in places, have been covered by volcanic products.

From 1850 to 1855, inclusive, the gravel deposits of California produced $335,553,456. The impetus given to the production of gold by the introduction of hydraulic mining astounded the world and revolutionized the science of hydraulics. Necessity developed the fact that ditches could be constructed running large quantities of water on grades and under conditions which the text-books pronounced impracticable. Investigation and experience soon discredited the formulæ then in use for determining the velocity of the flow of water in open channels and pipes. Aided by observations and investigations at home and abroad, the formulæ of the old text-books have been exploded and discarded.

The introduction of riveted iron pipe in the crossing of canyons and valleys of 100, to 1000, 1700 feet in depth, (11½ to 30 inches in diameter) several miles in length and the delivery of water through these light wrought iron, (from .083 to .375 inch in thickness) constructions under tensile strains from 15,000 to 17,000 and as high as 23,460 lbs. per sectional inch was a revelation in hydraulices. Many engineers at present state, although aware of the result of the work executed in this State, still consider the life of these pipes, whose thickness is the mere fractional part of an inch, to be necessarily short. We have samples of pipe of No. 14 iron, B. G., which has been underground and in actual service over 30 years. The iron in this pipe is as good to-day as when laid down.

Our experience with steel pipe is limited to about 15 years and so far it appears to work well, but we naturally incline toward the use of wrought iron pipe on account of long experience with it.

There are many other devices which necessities have brought out and among others notably the development of the Pelton wheel.

Having discussed this question of legitimate and speculative mining, it can be stated that if a moiety of ordinary common sense be used in mining transactions which is practised in everyday business life, there is no industry which would offer more legitimate inducement for investment or could be safer than gold mining on this coast.

The strained relation between the farmers and miners has caused the loss of millions to the citizens of this State. I am sure I can voice the feelings of the miner, that he never desired to harm his neighbor in any form, and stood ready at all times to act fairly and extend the hand of fellowship. Whoever he damaged, it was just to compensate.

In a State which is so sparsely settled in comparison with its area, the people can ill afford to be antagonistic and this condition of affairs cannot continue.

The problem in which we are most concerned is that of harmonizing the mining and agricultural interests. The equation is not impossible to solve. The intelligence of this people will work its solution and the day when these industries "pull together" will be the brightest in the history of this State and will assure our prosperity.

Gold in the Guyanas.

The following notes are taken from a paper by Henry G. Granger read at the Colorado meeting of the American Institute of Mining Engineers:

Paramaribo is the source of all labor and food supplies in Surinam. Labor has to be contracted before a commissioner, for a period of from three to four months, at the rate of 125 guilders, or about 50 cents gold per day, with rations and medicines free. Claims are taken up by going to the Government office and designating on a map the locality desired, having the quantity of land, not less than 200 hectares, (the hectare is 2.47 acres), marked off by scale and paying a year's tax. For the first three years this tax is 4 cents in gold per hectare, for the fourth 10 cents, and for the fifth and subsequent years 20 cents per hectare. If one desires to prospect new ground a certain number of leagues distant from any working placer, a large tract may be marked off, free of taxation for the first year. It is against the law to prospect or work ground that has not been regularly taken up.

The following are the six principal placers, with their reputed yields and present condition:

Barnett's	$3,000,000	Producing.
Green's	1,000,000	Producing.
Mueller's and de Joug's	500,000	Producing.
Dr Solomon's	500,000	Shut down.
Montana mine	250,000	Producing.
Savanna mine	150,000	Shut down.

There is an export duty on gold of 5 per cent.

The question naturally arises: What does the future offer for gold mining in Surinam? Quartz mining, with the proper men to develop it, should have a future in this country. Up to the present time it is an absolutely virgin field. A number of veins are known, some of them carrying free gold, but not a step has been taken to develop this branch of the industry. Regarding placer mining, the writer is of the opinion that, under the present conditions of labor contracts and transportation of food supplies, all the ground within available distance that is of any value has been taken up. The great interior, higher and healthier, is untrodden by the prospector's foot. Surinam, though a colony of Holland, has the management of its affairs in its own hands.

TABULATED STATEMENT SHOWING THE RELATIVE COST OF MINING AND MILLING PER TON IN CALIFORNIA, ALASKA AND SOUTH DAKOTA.

Elevation above Sea Level	Name of Mine.	Location.	Greatest Vertical Depth	No. of Stamps.	Cost of Mining, per ton	Cost of Milling, per ton	Total Cost, per ton	Yield, per ton.	Wages, per diem	Remarks.

Cost of labor at South African mines is from $12 to $15 per month.

Its people are intelligent and anxious for progress. It is very probable that any responsible parties who would go to the Government with something like the following proposition would meet with acceptance: Selecting a tributary to, say, the Saramacca river, flowing from the west, which could not be reached in less than, say, sixteen days' canoeing, ask the Government for an exclusive concession for forty years (the term of all their mine grants) for all of the teritory south of the chosen tributary and west of the river, upon the condition of payment of export duty for all the gold taken out, a monthly tax of, say, $100, and non-abandonment for over one year. The concession should include the right to introduce laborers from the West Indies (where they are a drug on the market) on contracts of not less than a year, and police authority over them.

Gold in Granite and Plutonic Rocks.*

By WILLIAM P. BLAKE, Tucson, Arizona

(*Condensed.*)

A recent paper by Prof. George P. Merrill, curator of the Department of Geology of the U. S. National Museum, Washington, upon "An Occurrence of Free Gold in Granite," describes an interesting instance of the dissemination of this noble metal in the substance of granite of normal composition believed to be from Sonora, Mexico. He found the gold in small scales, rarely exceeding a millimeter in diameter, distributed through the scales of mica and apparently enclosed in both the feldspar and quartz granules. A number of thin sections of the rock submitted to examination with the aid of the microscope gave confirmatory evidence. Sulphides were not detected, nor any indication of a secondary impregnation, though the granite had undergone some alteration, apparently by weathering. Mr. Merrill concludes that "there is apparently no way of accounting for the gold other than by considering it an original constituent of the rock, a product of cooling and crystallization from the original magma."

We have thus another link in the chain of evidence showing that gold is a constituent of granite and plutonic rocks, and that such crystalline rocks may be the primal source of the gold which is concentrated in veins.

We do not, however, overlook the fact that the oceans may have contributed a portion of their dissolved gold to the sedimentary rocks, such as the slates, magnesian or otherwise, of different geological epochs; such slates being generally known to us as country or wall rocks of most of the auriferous quartz veins, especially of the central gold region of California.

As investigation progresses, and our knowledge is increased, it becomes more and more evident that such pyritous sediments derived their metallic contents from the waters of the ocean at the time of their sedimentation, through the reducing agency of organic matters or the exhalation of sulphuretted or carburetted gases, as for instance, from the petroleum shales.

We encounter here the difficulty that gold is not uniformly present in pyritous deposits, as we might expect considering the universality of the oceanic source, and the general distribution of gold in this menstruum. But before we can generalize satisfactorily we require much more evidence regarding the dissemination of gold in the mass of the various kinds of rocks, independently of veins.

It is only within a few years that the instances of the occurrence of gold in the crystalline rocks have multiplied until we cannot longer regard them as exceptional, or hold that gold, as a rule, is confined to the magnesian and argillaceous slates.

One of the earliest cited and best examples of the occurrence of coarse, free gold in the midst of granite, seemingly without any extraneous origin by impregnation accompanied by quartz, was at the Armagosa gold mines at the sink of the Mojave river, San Bernardino county, Cal.

The native gold in visible masses was there disseminated in the midst of the aggregation of soda-feldspar (albite) and the quartz, as if an original constituent of the mass and indigenous to the rock, which it may have been. Pyrites were not present in the specimens obtained; but some fragments of white arsenic in granite from the same locality may be regarded as an indication of the former presence of an arsenide in association, and as possibly an impregnation subsequent to the formation of the rock.

The influence of dikes of plutonic rock upon the mineralization of veins with the precious metals has long been known and recognized by miners.

If we accept the theory of lateral secretion for the formation of mineral veins, such veins bearing the precious metals are perhaps as good evidence as we need of the diffusion of gold and silver in the mass of the adjoining country rock, or, at least, that solutions bearing these metals may traverse the rocks by osmosis or otherwise. If such evidence may be admitted, the range of the phenomena and of the evidence is widely extended.

Some of the most notable districts in California where gold-bearing veins traverse crystalline rocks of the granite family are at Grass Valley and Nevada, Nevada county; also at Forbestown, Butte county; Ophir, Placer county, and West Point, Calaveras county. In these localities the veins are numerous, and appear to have been formed from the substance of the country rock. In Mariposa county, at the southern end of the Mariposa estate, where the slates of the Jura-trias age, with their accompanying large mother vein, give place to granite, we find a vein of auriferous quartz which may not have any relation in origin to the vein in the slates, with which the vein in the granite contrasts strongly in its formation and in the distribution of the gold. It is known as a "pocket vein," yielding the gold in isolated but rich bunches, and of a higher grade of fineness and less crystalline than the gold of the Princeton vein, which traverses the secondary slates. It would be instructive to determine the relative ages of these adjacent veins and the influence of the two different kinds of country rock upon the deposition of the gold. It would be extremely instructive if we could find an instance of a gold-bearing vein passing from one formation into another, as, for example, from slates into compact granite, so as to exhibit the effects of change of country rock, or of the walls upon the mineralization of the vein—effects so strikingly shown in the lodes of Cornwall, which are copper-bearing in the "killas" and tin-bearing in the granite. It should be mentioned that the tin lodes are not without some gold, being thus indicative of its presence in the granite.

The well-defined granite rock of Butte and Walkerville, Mont., affords conspicuous examples of gold-bearing and silver-bearing veins, originating apparently by lateral secretion from the body of the granite on each side. The Rainbow and Blue Bird lodes especially appear to have derived their mineral and metallic contents from the granite in much the same way as the tin-bearing lodes are formed in Cornwall, according to the investigations of Le Neve Foster.

The occurrence of gold in thin flakes upon the surfaces and in crevices of the porphyry at the famous Contention mine at Tombstone, Arizona, has been shown; but it is not yet known with certainty whether this gold, either in its free state or combined with disseminate pyrite, was an original constituent of the dike, or whether it was derived from the diffused pyrites of the stratified beds traversed by the dike. So far as regards the plainly visible gold, it appears to be confined to the partly decomposed portions of the porphyry dike, at or near the contact with the other rocks, and to be a secondary or late deposition, and not indigenous.

The mines of the Homestake group in the Black Hills of Dakota afford a good example of the occurrence of gold in ancient crystalline gneiss or granitic schists of pre-Cambrian age. These schists are much plicated and are traversed by felsitic dikes, distinctly intrusive. Whether these are auriferous or not remains to be ascertained, and without a careful examination it is not possible to state the source of the gold, whether indigenous to the schists or introduced from the dikes or with quartz veins from remote sources. The rock for the stamp mills is quarried, rather than mined in the manner usual with veins, and this rock is milled together with any veins traversing it.

The ore of the Treadwell mine, Alaska, is described by Adams and Dawson as a hornblende-granite, "much crushed, altered, and impregnated with secondary quartz, calcite, and pyrite." The pyrites contains the gold.

In the gold-bearing region of northern Sonora, Mexico, the gold veins are chiefly in or closely associated with granitic and plutonic rocks. The veins of El Grupo concession, about 100 miles southeast of Tucson, Arizona, traverse a fine grained granite, and bear both gold and silver. A dioritic rock at El Plomo, in the same State, appears to be especially favorable to the occurrence of gold. At the San Francisco mines, 100 miles southwest of Gila Bend, Arizona, gold-bearing quartz veins traverse Huronian or pre-Cambrian gneiss near or at the contact with a great dike of diorite on one side and of porphyritic granite on the other. El Campana, a large quartz vein, also in Sonora, is at the contact between an obscurely defined felsitic rock, like granite, on one side, and a heavily-bedded quartzite (probably Cambrian) on the other.

In central and northern Arizona gold-bearing veins are found in granite. The famous Congress vein now worked to a depth of some hundreds of feet, traverses granitic rock in close association with a dike of plutonic rock. North of Indio, on the Colorado desert, California, in the second range of mountains a ridge of granite contains irregularly spread patches or bunches of pyrite which, by decomposition, liberate a small amount of gold. This pyrite does not appear to be connected with any vein, but seems to be one of the original constituents of the rock. Somewhat similar pyritic impregnations in granite were worked a few years since in Arizona, near Peeples valley and Rich Hill, north of Stanton, and yielded free gold.

The close association of gold and granite at Cripple Creek must not be overlooked. Some specimens of porphyritic granite with cavernous spaces partially filled with purple or amethystine fluorite are very rich in gold.

Penrose, in summarizing Chapter IV. of his monograph of the mining geology of the Cripple Creek district says:

The phenomena of the occurrence of the precious metals in the celebrated Mercur mining district, Utah, furnish evidence which may be used in support of either view of the primal source of these metals. Both sedimentary and plutonic rocks are there found in conformable layers, and gold has been found in both, but the commercially available deposits are long and near the plane of contact of porphyry and limestone, but below the porphyry, the deposits thus being what is ordinarily described by miners as a contact deposit.

In the representative series of gold specimens and ores sent by the Minister of Mines and Agriculture from New South Wales to the Columbian Exposition in Chicago in 1893, there were numerous specimens from granitic and feldspathic lode-stuff. Examples of the presence of gold in granitic and plutonic rocks might be multiplied, but those given are sufficient to show that we must recognize such rocks as truly gold-bearing.

* Trans. Am. Inst. M. E., Colorado Meeting, Sept., 1896.

A Cheap Cyanide Plant.

Written for the MINING AND SCIENTIFIC PRESS by M. A. KNAPP, Hawthorne, Nevada.

The erection of a cyanide plant is, as a rule, a rather expensive proposition; and for the benefit of any readers of the PRESS who may wish to put up a cheap and efficient plant to handle a small lot of tailings, or as an experimental plant preparatory to a more expensive and permanent one, I offer these notes of a small and a successful cyanide works constructed at Hawthorne. The means used to overcome some of the difficulties encountered may be of interest also to managers of more extensive plants.

The conditions here were rather peculiar, as the lot of tailings to be leached were from an arrastra, and extremely slimy, fully two-thirds being clean slimes. This drawback was compensated, however, by the fact that they had settled from intermittent flows (every twelve hours) from the arrastras, and in consequence were finely stratified, the fine micaceous minerals separating the layers. If these lumps of slimes were once thoroughly dried, upon soaking with water again they would crack and flake throughout, and allow thorough leaching. By repeated tests I have found that lumps 3 inches in diameter, if near the top of the material in the vat, would leach excellently, although the aim was to handle considerably finer stuff. As any heavy pressure would pack such material, the vats were built very shallow, being 2 feet deep and 12 feet square. The first solution was added slowly from the bottom, and care having been used in putting the material into the vat lightly, without tamping, I found but little tendency to settle as long as the surface of the solution or wash water did not fall below the level of the top of the tailings in the vat.

The small amount of material in sight to be handled would not justify the purchase of expensive tanks, especially since an exceptionally large amount of leaching surface was required, owing both to the shallowness of the leaching and its extreme slowness in this slimy material. A cheaper method of building vats had, therefore, to be found; and after a few experiments the following was adopted: A row of seven boxes, 2 feet deep and 12 feet square, braced from the outside every 4 feet, was built, surfaced lumber, 1½-inch stuff, being used throughout; but no extra precaution being taken in the construction beyond thorough nailing. Over the cracks strips of canvas 3 inches wide were laid on top of a streak of hot (but not boiled) asphalt—grade D of the California Asphalt Company. A sheet of canvas of medium weight, 16 feet square, sewed with double seams, was then laid down in the vat and folded up in the corners, the side next the board being covered with a good layer of hot asphalt just as it was laid, causing it to stick fast to the wood throughout. The upper edges were tacked to the vat, no other tacks being put through the canvas. The inside of the canvas lining was then thoroughly asphalted, with special care about the corners. The vat floor inclined 1½ inches in 12 feet, both east and north. In the northeast corner, 1 foot from sides, the floor had been cut ⅝ inch deep in a saucer-shaped depression, and a hole for a 1¼-inch pipe bored. This was put in through a hole in the canvas and bolted tight in hot asphalt with 3-inch washers on the canvas and on the plank below.

Filters were of double burlap on 1-inch square strips, 1 inch apart, laid diagonally on the canvas bottom to within 6 inches of the sides, these held in place by canvas strips tacked across. Four strips—1x4x11 feet 6 inches—cut at 45° angle on corners were laid around the bottom of the vat, a small roll of burlap being tacked to the thin under side, which stuck to the still warm asphalt. To these strips was fastened the burlap filter.

The outlet pipe bent at right angles 3 inches below the vat. A short piece of hose was wired on it, and into the end of the hose was pushed a wooden spigot,

which drained directly into a 2x4-inch launder running alongside the vats to the zinc house. This launder was lined with a strip of asphalted canvas, and covered tightly except at the spigots. The same method of preventing leakage by means of asphalt and canvas was used in the construction of zinc boxes and solution tanks, the latter being built on the same general plan as the vats.

The pumping from sump tank to old solution tank was done by a small-sized Pelton motor, so set that the waste water from it could be used in leaching. Solutions were carried to the vats from the tanks by means of rubber hose.

So much for the construction, which was certainly cheap; and I will warrant that it was also efficient, though I would not recommend the use of vats of this description in any case when the proposition would warrant the erection of substantial, well-built wooden tanks. With proper care, however, in the use of well-seasoned lumber and good grade of asphalt, these vats last very well. A leak is easily mended by a new coat of asphalt, and this should be applied every four or six weeks as a precautionary measure. The tanks and vats here have given excellent service, and are now being used to leach tailing from a 5-stamp mill since built on the ground.

Among some of the difficulties encountered here I found, early in my experience, that the solution coming from the vats was too weak to precipitate on the zinc properly, and therefore added a little of a strong, strengthening solution to it before it entered the zinc boxes. Also, trouble was encountered by use of very coarse zinc shavings procured in San Francisco. Later on a very fine, flossy zinc answerd far better.

My first cleanups were made by burning off the fine zinc in large crucibles and fluxing the residue with borax and soda, a very dangerous proceeding, not alone from the loss of silver with the zinc, but in consequence of the liability of salivation from the fumes of mercury, which is caught by the cyanide along with the gold and silver of the tailings. The method employed later, resulting in a great saving of time, fuel and crucible, was to eat the most of the zinc with dilute sulphuric acid in asphalt-lined barrels, filter through a close linen cloth, dry slowly on an iron plate, stirring to prevent caking. Beware of mercury poison here also. Mix thoroughly with about equal bulks of powdered soda and borax. The borax is first dried, so as to boil away the water in it, and then ground fine. A thorough mixing of the powdered material makes it possible to melt very quickly and easily in a hot fire, and saves the black lead crucibles from corrosion.

How To Frame a Report.

The following blank form of report was framed to assist practical miners and mine owners, who may lack the technical knowledge of the mining engineer, in making a comprehensive report on such mining properties as they desire to present to investors. It is condensed from a blank form copyrighted by Bernard MacDonald of Butte, Montana:

REPORT ON THE

.....group of mines,
by.....

.....
.....

DEAR SIR:—The undersigned beg to submit to your consideration the following report on the.....lode claims comprising the.....group.

Number of Claims, Area and Date of Location:

The....claim is..ft. long by..ft. wide, located....189
The....claim is..ft. long by..ft. wide, located....189
The....claim is..ft. long by..ft. wide, located....189
The....claim is..ft. long by..ft. wide, located....189
Total area of group about.....acres.

Geography:

This.....claim.....situated in.....mining district....organized, ... county, ...State, and ....distant in a.....direction.....miles from..... the nearest railroad station. The county seat (.....) is distant....miles in a....direction, and is reached by.....over.....

Historical:

The.....mining district was first discovered in 18..by.....

(The first discoverers and namers of the district, the first claims located and worked, the principal historical events and mining operations that have occurred in the district till the present time should be given under this heading. Such information can generally be had with sufficient accuracy for the purpose of the report from the pioneers of the district. All recorded transactions can be obtained from the county records when desirable. Parties largely interested in any mining district should take a pride in collecting and writing up in chronological order all the historical information connected with it. The first mining failures in a district do not detract from its merits, and if frankly told would probably lead to early investigation and perhaps a solution of the causes. Mining newspapers in the district will gladly publish accounts, and a clipping of this would be suitable for this section of the report.)

Accessibility:

From.....station on the.....railroad, this property is reached over.....miles of.....wagon road and.....miles in length—a total length of.....miles from the railroad. The elevation at the mine..is.... feet higher than the railroad station, and.....feet above sea level.

.....
.....

(The blank lines may be filled ont with estimates for the building of new wagon roads, trails, or for the improvement of existing ones.)

Titles:

Title to.....of th..claim..is vested by the right of location, and title to.....of th..claim..is vested by United States patent.. There is.....dispute or counter claim to the present owners' possession of these claims. There is.....indebtedness or incumbrance against the property amounting to $.....due..... This form is filled on information from.....

(The number of claims in the group held by right of location and the number by United States patents should be given here. It should be ascertained whether there is any dispute for the possession of the property, or litigation pending; also whether there is any debt or incumbrance against the property, and the facts stated. These can be found by consulting the county records. The authority for such information should be given at the bottom of the form.)

General Characteristics of Vein...:

The.....vein..ha..the following characteristics: Strike.....; dip.....degrees from the horizon; width varying from .....feet; outcrop.....traceable for a distance of.....feet; hanging wall.....; foot wall.....; vein filling.....; oxidized ore extends down about.....feet.

Geology:

The country rock on the hanging wall of th..vein.. is.....; on the foot wall side it is.....; dikes of .....occur..... The country surrounding the immediate vicinity of the mines is composed of..... and is drained by.....creeks, tributaries of the .....river.

(The names of the rocks enclosing the vein on foot and hanging wall sides should be given here, and the class and character of the dikes, if any, occurring in the neighborhood of the veins should also be filled in. The character of the country rock surrounding the immediate vicinity of the mines should also be given, and the names of the creeks draining the hills or mountains on which the mines occur, and the river into which they empty. Mine owners should make a thorough study of the formation enclosing the veins, and the dike system (if there be one) occurring in the neighborhood. For the time necessary to spend for this work, nothing pays better. A thorough understanding of the geology of the country enclosing the veins frequently gives its possessor the key to the bonanza ore bodies of the group.)

Developments:

On the.....claim there are: ....shaft.....; ....open cut.....; ....tunnel.....; ....drift .....; ....raise.....; ....winze .....

(It is very important that all development work should be accurately measured and located with reference to the boundaries of the claim and position of the vein, and this should appear on the maps forwarded with report.)

Mining Facilities:

FUEL—For this there is a.....supply of timber. Cordwood costs $.....per cord delivered at the mine. Coal costs $.....per ton delivered at..... Charcoal costs $.....per bushel at the mine.

MINING TIMBER AND LUMBER—Timber for stull and tunnel sets ranging from....to....inches in diameter can be delivered at the mine at a cost of from ....c. to ....c. per running foot. Lagging poles cost ....c. per 15-feet lengths. Lumber at a cost of $.....per thousand at.....

WATER—For domestic purposes, there is..... water within....feet of the mine. For steam purposes, there is.....water within....feet of the mine. For power purposes, there is a flow of.... cubic feet, for which a fall of....feet can be had at a suitable site for a plant by taking it through a ditch ....feet in length. Such a ditch could be built for $.....per rod.

SUPPLIES—Hardware, etc., can be had at..... prices, with freight of....c. per lb. added. Farm produce.....flour costs from....c. to....c. per lb.; potatoes,....c. to....c. per lb.; beef,....c. to....c. per lb.; ranch butter,....c. to....c. per lb.; creamery butter,....c. to....c. per lb.; canned fruit,$.... per case; oats, $....per 100 lbs.; hay, $....per ton. General groceries cost a trifle over.....prices.

LABOR—Miners' daily wages, $....; carmen's daily wages, $....; teamsters' monthly wages, $....; carpenters' daily wages, $....; blacksmiths' daily wages, $....; common top labor, daily wages, $... ; four-horse teams, with teamster, daily wages, $....

CONTRACT WORK—Cross-cut tunnels, 4½x6½ feet in the clear, can be run by contract for $....per foot; drifts on veins, 4½x6½ feet in the clear, can be run by contract for $....per foot; raises on vein, 4½x6½ feet in the clear, can be run by contract for $....; incline shaft on vein, 5x7 feet in the clear, can be sunk for $....per foot.

Ore Tonnage in Sight and Value Thereof:

In the.....claim there are about.....tons of ore in sight, having an aggregate value of about $..... per ton. The ore is exposed by the.....

(In calculating the tonnage and value of ore "in sight" in a mine, the most conservative practice demands that three sides of the ore body be exposed by the developments, but this in all cases is not necessary. If the vein is regular, an ore chute cut by several levels may be considered sufficiently developed to admit of close calculation as to its tonnage and value of the ore above lowest level. Two sides of an ore body may be oonsidered sufficient for this calculation, allowing a one-third discount when the developments of a mine are limited and the ore chutes are not known to be regular. It should be stated plainly by what developments and their dimensions the ore is placed in sight.

Assays:

Samples taken by.....and assayed by.....ran as follows:

No.	Description.	Gold, Value per ton.	Silver, Ounces per ton.
1.	.....	$.....	.....
2.	.....	.....	.....
3.	.....	.....	.....

Gold calculated at $20 per oz.
Silver calculated at....per oz. Gen'l average, $....per ton.

(The description of samples assayed should clearly express the character of the ore, the width of the streak or vein, and the locality from which it was taken. The name of the party by whom the samples were taken, and that of the assayer, are to be given. While, in order to learn the characteristics and the grade of the various classes of ore in a mine, it is necessary to take a number of specimen or characteristic samples, yet such samples do not furnish the proper data to estimate the average value of the ore upon. Cold average samples of the various streaks in the vein, if it is wide and carries different grades of ore, should be taken, and these should be checked by average samples of the entire vein.

Shipments and Proceeds:

There have been....tons of first-class ore shipped to the.....which netted $....per ton. Also.... tons of second-class ore to the.....which netted $....per ton....

Estimated cost of mining this ore, $....per ton....
Cost of wagon transportation, ...per ton....
Cost of railroad transportation, ...per ton....
Cost of treatment, - - - - - ....per ton....

Total expense, - - - - - $....per ton....

(This blank is to be filled from the statements of settlement had from the reduction plants to which the shipments were made; and it would be proper if duplicate statements were enclosed with the report, or the accuracy otherwise attested.

Reduction Plant:

The ores of this property are suitable for reduction by the.....process.. A reduction plant of this character, of....tons daily capacity, will cost, erected and ready to run, $.... Estimate by.....

(When the ores below water level are sufficiently developed they should be sampled by a series of practical milling tests in various reduction works to ascertain the methods best adapted to their reduction. When the proper method and capacity of plant have been decided upon, proposals for the erection of such a plant should be asked of the various manufacturers. Their offers, the character and capacity of the plant should be inserted in this blank. If the mine is not sufficiently developed for such an estimate, the writer can make a forecast in his own words of the probable best method of reduction.)

Estimates of Profit with Plant Recommended:

....tons per day of assay value of $....per ton, $....
Loss in treatment....per cent, - - - $...
Cost of mining....tons, at $....per ton, ...
Cost of transpor'n...tons, at $...per ton, ...
Cost of reduction....tons, at $...per ton, ...
All other items of expense, say $...per ton, ...

Total cost, - - - - - - - - - - $....$....

Net profit per day, - - - - - - - - - - $....
Net profit per month, $....

(Liberal estimates should be made of all items of expense, as these for the first year or two generally run higher than in plants longer established.)

Prices and Terms of Sale:

The parties .....will sell for $....payable in..... installments of $....each. First.....; second..... months thereafter.....; or they will lease and bond it for.....years.....under the following conditions: .....

Enclosures:

Herewith please find enclosed: Maps.....; assays.....; report..by.....; letter..by.....; newspaper clippings from.....; photographs.....

(Under this heading should be given a list and description of maps, assay certificates, reports and letters, with names of writers; newspaper clippings and photographs of the mine in question, which are sent with report. All these go to make up the evidence necessary to investigation of the merits of the proposition.)

Directions and Time Necessary to Reach the Property:

Recommendations:

.....

Electrical Progress.

Electric Mining.

The following notes are taken from an interesting paper on "Electric Mining in the Rocky Mountain Region," by Irving Hale of Denver, read at the Colorado meeting of the American Institute of Mining Engineers:

Conditions Affecting the Cost of Plant.—The cost of an electric transmission plant depends chiefly on three conditions:

First.—Nature of water power (assuming such power to be used) and cost of developing it.

Second.—Distance of transmission.

Third.—Electro-motive force or voltage used.

In order to show more clearly the effect of distance and voltage on cost of plant, it may not be inappropriate to state briefly the principal electrical laws involved in the problem.

Electrical Laws and Formulæ. (1) Electro-motive force, "pressure" or voltage (symbol, E. M. F. or E.; unit, the volt) corresponds to pressure of water in pounds per square inch, or head in feet.

(2) Current (symbol, C.; unit, the ampere) corresponds to flow of water in cubic feet per second.

(3) Power (symbol, P.; unit, the watt) corresponds to the power of falling water, and is equal to the product of electro-motive force and current, just as water power is proportional to the product of pressure or head and flow. 1 Kilowatt = 1000 watts. 1 H. P. = 746 watts. 1 Kw = 1⅓ H. P. Formula, $P = EC$.

(4) Resistance of a conductor to the transmission of electric current (symbol, R.; unit, the ohm) corresponds to the friction of water in a pipe. This resistance is directly proportional to the length of the conductor, and inversely proportional to its area of cross-section.

(5) The electric current is equal to the electro-motive force divided by the resistance. This is also analogous to the flow of water, which increases with the pressure and decreases as the resistance or friction increases, although the law is not exactly the same.

Formula (Ohm's law), $C = \frac{E}{R}$.

(6) Energy wasted in a conductor by being converted into heat (symbol, H.; unit, the watt, as before,) corresponds to the waste of power, also converted into heat, by the friction of water in a pipe, and is equal to the square of the current multiplied by the resistance.

Formula, $H = C^2R$.

(*A*) From (4) and (6) it is evident that increasing the distance, and, consequently, the length of wire (other things remaining the same), will proportionately increase the resistance and the loss of power; but if the cross-section of the wire is increased in the same proportion as its length, the resistance and loss will remain the same. This, however, increases the weight of the wire as the square of the distance. Hence the law: For a given power and electro-motive force (which fixes the current) the cost of copper, for a specified percentage of line loss, varies as the square of the distance.

(*B*) From (3) it appears that the same power is obtained from high electro-motive force or voltage and small current as from low voltage and proportionately large current—another analogy to water power. But (6) shows that the loss of power varies as the square of the current, and hence *inversely* as the square of the voltage. If the loss (C^2R) is to remain the same, R can be increased as much as C^2 is decreased, or as much as E^2 is increased, which means that the cross-section and weight of the wire will be inversely proportional to E^2. Hence the law:

For a given power and distance the cost of copper, for a specified percentage of line loss, varies inversely as the square of the voltage.

(*C*) combining (*A*) and (*B*) the following law is established:

If the voltage is increased in proportion to the distance, the cost of wire for transmitting a given power with a specified line loss remains constant.

Considering the fact that the total cost of steam or water power, electric generators, switchboard and motors seldom exceeds $150 per kilowatt, it is evident that when a distance is reached that makes the cost of wire (and transformers, if used) exceed that amount, or the entire cost of the remainder of the plant, that distance may be considered to be near, if not beyond, the economical limit, unless the conditions are peculiarly favorable for electric power.

With 500 volts this condition is reached inside of three miles; with 1000 volts, inside of six miles; with 3000 volts, at about seventeen miles, and with 10,000 volts, at about fifty miles, allowing for transformers.

It is evident from the foregoing principles and figures that the key to long-distance transmission is high voltage.

Electricity and Rifle Practice.

The committee of the Swiss Federal Rifle meeting at Winterthur found that nearly all the shots fired from the right side of the range had hit the target to the right of the bull's eye, while those fired from the left side had, with an equally singular persistency, hit the left half of the target.

An examination of the steel-clad bullets extracted from the targets disclosed the fact that they had become magnetic, and this led the committee to entertain the theory that the phenomenon might have been due to electric influence exerted by the large number of telegraph and telephone wires which run along both sides of the range at Winterthur. Further experiment at the ranges of Thun and Berne proved this theory to be correct. The following account of one of the experiments is given by the *Journal de Geneve:*

"At Thun authorities established parallel with the rifle range, at a distance of a little more than 40 yards, an electric current of 8000 volts, carried along four steel cables. With a view of tracing the whole effect, paper circlets were placed at every ten yards. The first experiments were made with the Swiss model rifle of 1889. With this the influence of the electric current was at once apparent. In a distance of 260 yards the bullet took a lateral deviation of 24 yards, and after that the curve of the trajectory was still more marked. The second experiments were made with the Japanese 3.3 mm. rifle of Col. Yamagata, and they were still more decisive, the bullet being rapidly attracted to the electric wires and following their course with absolute servility. Further attempts were made with artillery. The range selected was one of 3000 yards, and 200 yards in front of the targets, but 40 yards to the side was placed the electric battery. Every shot was diverted by its influence far to the side of the target—to be exact, the deviation was one of 14°.

"The conclusions drawn from these experiments are that a section of infantry exposed to fire at 300 yards would enjoy complete safety if a dynamo or accumulator were placed on its flank; a whole company would be in the same security at 500 yards, and artillery fire could be rendered innocuous at 1000 yards. If these facts are sound, the new small bore rifle is doomed, and we shall have to return to the heavy bullet of lead, because it is unaffected by electricity. But to military reformers this will signify a repulse along the whole line."

Electric Farming.

The agricultural department of the Cornell University recently published the results of some experiments extending over a period of six years, upon the effect of the light of the electric arc lamp upon the growth of plants. It was found as a result of these experiments that there was a decided beneficial influence on the growth of lettuce, and that there can no longer be any doubt as to its advantages in forcing this plant. With seed sown under ordinary conditions and the young plants placed under the influence of the light after they are well established, will show marked improvements up to a distance of forty feet. One curious thing was noticed, that the effect of the shadow of a beam or rafter cast by the electric light showed plainly on the leaves. It is stated in this report that a fancy truck farmer near Boston now uses the electric light in the commercial forcing of lettuce. He has three lamps of 2000-candle power each, which run all night. The hothouse covers nearly one-third of an acre. He finds that he obtains a gain of five days per crop during the winter, which makes a gain of three weeks for the three crops during the winter. The gain from one crop, he estimates, is sufficient to pay the expenses of operating the electric lights during the whole season.

Prof. Bailey states that he finds that many plants grow more rapidly when under the influence of the electric light at night. Among these are the daisy and the violet.

Scientific Progress.

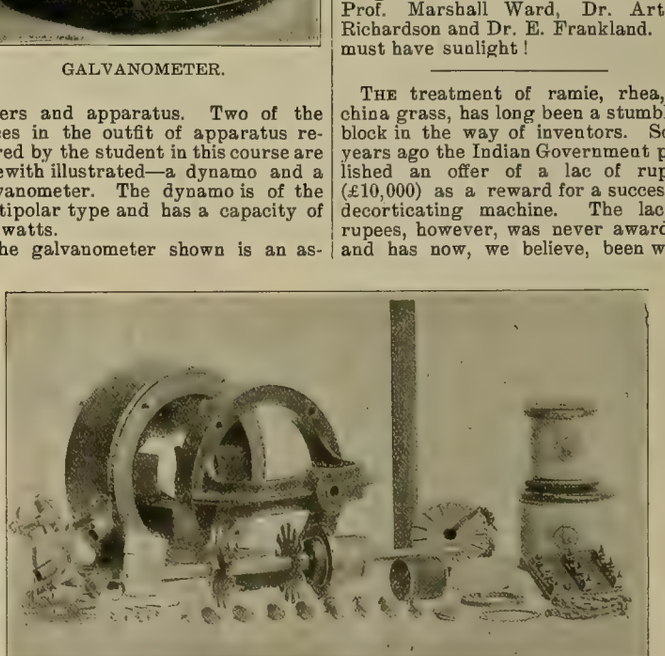
Electricity Taught by Correspondence.

A new method of teaching electrical engineering under the correspondence plan has been adopted by the Institute for Home Study of Engineering of Cleveland, Ohio. The electrical instruction is given in connection with the use of apparatus at the student's home. The Institute supplies the

GALVANOMETER.

papers and apparatus. Two of the pieces in the outfit of apparatus required by the student in this course are herewith illustrated—a dynamo and a galvanometer. The dynamo is of the multipolar type and has a capacity of 250 watts.

The galvanometer shown is an astatic instrument with a resistance in the coils of about one-half ohm, and may be classed as a reflecting galvanometer of low resistance. It is adapted for the detection and measurement of low electro-motive forces and will be found of special use in the measurement of current produced by thermal electric action and by induction in the earth's field. It is especially adapted as a galvanometer for use in testing with a Wheatstone bridge.



DYNAMO USED IN ELECTRICAL INSTRUCTION.

Aluminum Bronze and Its Uses in the Arts.

The aluminum bronzes are the alloys of aluminum and copper, in which the amount of copper considerably exceeds that of the aluminum. Aluminum containing small quantities of copper is not designated as aluminum bronze. Copper containing fron 13 to 90 per cent of aluminum is brittle, and at present has no use in the arts. The useful bronzes are those containing from one to twelve parts of aluminum.

Although aluminum bronze was discovered by the late John Percy almost forty years ago, and its valuable qualities fully appreciated, its use in the arts was retarded by the continued high price of aluminum. It was not until the discovery of cheaper methods of aluminum production that the bronzes received commercial attention.

The value of the aluminum bronzes lies in their non-corrosive properties and great strength. In the former they nearly rival the noble metals; in the latter they surpass iron and compare favorably with steel. The non-corrosive property is not confined to any particular mixture, but characterizes all the alloys. This property is undoubtedly due to the minute film of oxide of aluminum, which is formed on the surface of the metal when exposed to the air. This film is imperceptible, but undoubtedly imparts the quality of resisting corrosion.

In his address as president of the chemistry and engineering section at the recent meeting in Glasgow of the British Institute of Public Health, Prof. William Ramsay explained how the violet rays of sunlight act upon moist organic matter, producing hydrogen peroxide; how this peroxide becomes water, and hands on the remaining portion of oxygen to the organic matter, which it thus destroys or changes. Now, these changes are destructive to the life of minute organisms, such as the bacteria in sewage, and the germs of many, perhaps all, zymotic diseases, such as typhus and anthrax. These are the conclusions to be gathered from the recent work of Prof. Marshall Ward, Dr. Arthur Richardson and Dr. E. Frankland. We must have sunlight!

The treatment of ramie, rhea, or china grass, has long been a stumbling block in the way of inventors. Some years ago the Indian Government published an offer of a lac of rupees (£10,000) as a reward for a successful decorticating machine. The lac of rupees, however, was never awarded, and has now, we believe, been with-

fiber are now confronted with a more formidable obstacle than any they have encountered, and that is the difficulty of getting any adequate supply of the rare fiber at all. There are now ramie works in going order, recently established at Staines, where about three tons of filasse are reported to be turned out every week. But the owners recognize that until something can be done to secure a plentiful supply of the fiber, and at a reasonable price, the ultimate success of the works can hardly be anticipated. They estimate that it will pay the grower handsomely to cultivate ramie at a selling price of £6 per ton, hand-stripped. It cannot be obtained at present under more than double that price.—Industries and Iron.

Mechanical Progress.

ACCUMULATION of waste glass is one of the bores of glass-house managers. A little of the broken or condemned glass can be used again in the batch, but what to do with the piles left is sometimes a hard riddle to solve. Garchey, a Frenchman, has solved this riddle. He grinds the waste glass and puts the powder into a metallic mold which he introduces into two furnaces in succession in order to devitrify the mass. The first furnace serves for the gradual annealing of the mass so that all the parts are devitrified as uniformly as possible. The mold remains about one hour in this furnace. Owing to their pulverized condition, the glass molecules are finely separated and suffer very quickly the devitrifying action of the heat. Becoming soft, the molecules weld together and form a very consistent dough. In this condition the mold is taken out of the furnace and put into the second furnace that is heated up to a very high temperature. In this furnace the mold is left for only a few minutes. This second operation is intended to complete the devitrification and to make the mass more pliable. Then it is ready for being pressed into different shapes. Garchey produces in this manner all kinds of ornamental or other building stone, which is generally called ceramic stone.—American Manufacturer.

A MATTER which is just now engaging considerable attention in the Midlands is the possibility of American pig iron becoming an active competitor in the district, and some merchants are basing their calculations as to lower prices upon the probability of American iron forcing down some of the English brands, says *Machinery* of London. The successful competition of American iron is, however, regarded in well-informed quarters as too dependent upon temporary and special conditions to assume anything like the character of a permanent or established trade. This competition is, however, increasing, American iron being offered against Lincolnshire at 6d under makers' quotations for the above brand, while local merchants are in direct negotiation with American makers for bringing over considerable quantities of iron to this country, one offer which is under consideration, subject to favorable freights, being on the basis of 38s delivered at Liverpool.

OFFICIALS of the Erie Railroad are considering the advisability of establishing the use of horseless carriages in connection with railroad passenger business. The company proposes to arrange matters so that a passenger can telephone the city ticket office, notifying the agent that he wishes to take the train, and a horseless carriage will carry him to the station from his home at the proper time. The maintenance of the vehicles would be practically nothing, and the company's service would be greatly improved. The scheme will probably be experimented with in New York first.

A BICYCLE TIRE has been invented in which feathers are used. It is contended that, when a puncture occurs, the first tendency is for the down to be carried up into the puncture by the pressure of the air on the inside.

Practical Information.

Western Real Estate and Building.

The accompanying table, compiled by the *American Land and Title Register*, shows the total amount of real estate transfers at twenty Western cities for the months of July and August:

	July, '96.	*Aug., '96.*
Chicago	$7,690,000	$6,188,512
St. Louis	4,361,000	4,720,265
San Francisco	757,928	826,298
Pittsburg	922,714	1,265,000
Detroit	1,161,210	1,062,338
Milwaukee	565,800	498 250
Minneapolis	376,700	778,064
Omaha	790,800	698,500
St. Paul	256,687	306,602
Kansas City	1,100,360	1,062,730
Denver	620,000	615,908
Indianapolis	620.000	598,709
Portland	520,000	523,600
Toledo	356,000	375,000
Des Moines	450,000	475,290
Duluth	291,749	317,068
Grand Rapids	400,000	406,300
Seattle	460,000	379,086
Tacoma	262,265	579,734
Los Angeles	1,350,665	1,758,209

The following table shows the total estimated cost of buildings for which permits were issued in thirteen principal Western cities during August of this year and of 1895:

	Aug., '95.	*Aug. '96.*
Chicago	$3,267,000	$1,852,650
Cincinnati	221,777	296,520
St. Louis	2,497,690	2,786,950
Pittsburg	231,314	560,800
Detroit	271,700	786,240
Minneapolis	341,620	267,918
Omaha	42,449	106,850
St. Paul	151,375	69,730
Denver	75,000	120,700
Indianapolis	295,749	276,917
Duluth	69,450	76,850
Kansas City	238,450	276,892
Los Angeles	462,955	296,274

A FRENCH statistician, P. D'Amfreville, has recently made new estimates of the population of the globe and produces the following figures: Asia 825,954,000, Europe 357,379,000, Africa 163,933,000, America 121,713,000, Oceanica and the Polar regions 7,500,400, Australia 3,230,000; a total of 1,479,729,000. In Europe the number of inhabitants to the square mile is 95, in Asia 48, in Africa 15, in America 8, in Oceanica and the Polar regions 3, and in Australia 1. Accordingly, Europe contains for each of its inhabitants 2.8 hectares of land, Asia 5.2 hectares, Africa 17.6 hectares, Oceanica and the Polar regions 84.0 hectares, America 31.12 hectares, Australia 235.6 hectares. [A hectare is equal to 2.741 acres.] The yearly increase of population on the globe is about 5 to every 1000. At this ratio the population of the earth would be doubled every 139 years. In reference to the density of population, Belgium takes the lead with 546 to a square mile, followed by England with 312, Italy with 263, Germany with 237, France with 184, Austro-Hungary with 171, Spain with 90, Russia with 49. The average of all the other countries is 47 to a square mile, and the average for all Europe is 96. In Asia the 826,000,000 are distributed in the following manner: China takes the lead with 350,000,000, British India with 278,000,000, Japan with 40,000,000, East Indian Islands with 39,500,000, French possessions in India with 19,000,000, Corea with 10,500,000, English Burma with 7,500,000, Persia with 7,500,000, Asiatic Russia and Turkestan with 7,500,000, Siberia with 4,500,000, Afghanistan with 4,000,000, Ceylon with 3,000,000, Aribia with 2,500,000, all other parts of Asia with 43,500,000.

New Metals for Coins.

Advices from Washington, D. C., state that experiments with pure nickel and aluminum as substitutes for the present nickel pieces and one and two cent bronze pieces will be made at the mints by order of Director Preston shortly. A resolution was passed by the House of Representatives authorizing such experiments. There is some doubt whether the actual adoption of a new metal for the minor coins will be recommended at an early date by the treasury officials, even if the experiments prove successful. The objection to a change in any form of coins or notes is the disposition of the public to refuse the old forms and insist upon having the new. This would drive into the mints for recoinage $14,000,000 in nickel pieces, which are now in circulation, and $7,500,000 in pennies. The advantage claimed for pure nickel, instead of the alloy now used in five-cent pieces, is its greater hardness, durability and distinctness of impression.

IT is reported that it now seems certain that an electric road will be built between Chicago, St. Paul and Minneapolis, it practically having been decided that the corporation back of the enterprise wll be given a franchise to run in the streets of St. Paul. The matter has been under way for two years, but it was not until a few months ago that the required capital was procured to go ahead with the construction.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

THE OVERLAND LIMITED,
VIA
UNION PACIFIC.

Only 3 1-2 Days to Chicago-----3 1-2.
Only 4 1-2 Days to New York---4 1-2.

The Union Pacific is the only line running Pullman double Drawing-Room sleepers and Dining Cars San Francisco to Chicago daily without change. Only one change to New York; dining car service entire distance. Vestibuled composite buffet smoking and library cars between Odgen and Chicago.

The only line running upholstered Pullman Tourist sleepers San Francisco to Chicago daily without change, and personally conducted excursions to St. Paul and Chicago without change, leaving San Francisco every Friday.

Tickets and sleeping-car reservations at No. 1 Montgomery St. Steamship tickets on sale to and from all points in Europe. D. W. HITCHCOCK, General Agent, San Francisco.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,

Coast Industrial Notes.

—The new electric steel car system for Santa Barbara was put in operation last week.

—A meeting of farmers is to be called to consider the question of starting a beet-sugar factory in or near Santa Rosa.

—On Monday the people of Fresno celebrated the opening of the San Francisco & San Joaquin Valley road to traffic from that city.

—The business of the Albany Woolen Mills Company has been placed in the hands of a receiver. The assets are $140,000 and the liabilities $120,000.

—Last Wednesday the single-wheel mill at the Santa Cruz powder works was blown up by the explosion of 200 pounds of fuse powder. No one was injured.

—The growing trade between Puget Sound and Central America has caused the establishment of a second line of steamers between Tacoma and the southern continent. The first line was started a year ago when the steamer Transit was put on by a local company. Now comes the announcement that the British steamer Amarapoora is en route from Hongkong to load a general cargo for La Libertad and other Central American ports, sailing October 25.

—The Manufacturers and Producers' Association has invited the following bodies to participate in a meeting to be held Thursday, October 29th, to devise ways and means of cooperating in the work of the development of the State: Chamber of Commerce, Merchants' Association, Board of Trade, Produce Exchange, Merchants' Exchange Association, Board of Education, Board of Health, Builders' Exchange, State Agricultural Society, State Horticultural Society and State Viticultural Society.

—Maj. Charles Davis of the United States engineers has been in San Diego with surveyors to decide upon locations for four big guns at Ballast Point, for the defense of the harbor. Already $65,000 has been spent at Ballast Point for battery foundations. Possibly these foundations can be used in placing the new guns. Maj. Davis is negotiating for fifty acres of land south of Hotel del Coronado, on which sixteen mortars of twelve-inch caliber will be placed. He will receive bids on October 22 for the continuation of the government jetty on which $40,000 will be spent this year. The Old Town level is also to be repaired. The expenditures for the proposed coast defenses will, it is estimated, amount to several hundred thousand dollars.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPTEMBER 29, 1896.

568,596.—REDUCING ASPHALT—J. W Barnes, S. F.
568,658.—FIRE EXTINGUISHER—J. Buchtel, Portland, Or.
568,659.—SPRAY NOZZLE—J. Buchtel, Portland, Or.
568,563.—CULTIVATOR—J. F. Ebersole, Salem, Or.
568,609.—STOVE DRAFT—T. B. Gilmour. Dayton, Wash.
568,681.—CLEANING WHEAT—Hibberd & Herlitz, Port Costa, Cal.
568,682.—ADHESIVE DEVICE—A. A. Honey, Tacoma, Wash.
567,488.—WAVE MOTOR—Lemon & Bartlett, Los Angeles, Cal.
568,625.—FOLDING CHAIR—H. Owens, Montesano, Wash.
568,701.—LOCK—W. D. Roberts, Portland, Or.
568,460.—SCREW DRIVER—M. H. Schay, Tacoma, Wash.
568,503.—BICYLE SEAT SUPPORT—C. H. Watson, Riverside, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & CO., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

IMPROVED MINERS' LANTERN.

A light, simple, cheap and efficient Lantern, which will remain lighted in the strongest drafts. County or State rights for sale on royalty. MRS. HATTIE DELZELL, Jackson, Cal.

Books Received.

"The Mineral Industry for 1895"—Volume 4—has been received. It contains many valuable papers on special subjects connected with mining, besides a large amount of statistics, and will be of value for ready reference. Some of the special papers are as follows: "The Mining Stock Markets;" "Progress in Ore Dressing;" "An Outline of Current Views Upon the Origin of Ores," by J. F. Kemp; "How Deep Can We Mine:" by A. C. Lane; "Force of U. S. Mineral Land Patent," by R. W. Raymond; "Electricity in Mining Work," by T. W. Sprague; "Progress in Electro-Chemistry, Etc.," by Dr. W. Borchers; "Ditch Construction in Idaho," by A. J. Bowie. The book is edited by Richard P. Rothwell and published by the Scientific Publishing Company of New York. Price $5.

THE Department of Geology of the University of California, Prof. Andrew C. Lawson, editor, has issued a bulletin on "Some Pliocene Ostracoda from Near Berkeley," by Frederick Chapman. For sale by the University librarian, Berkeley, Cal. Price 10 cents.

Recent California Mining Incorporations.

Eureka Oil and Mineral Company, Fresno; D. Hattie, R Lochead, J. D. Graig, G. M. Brodrick, R. E. Potter; capital stock, $176,000—all subscribed.

Henry Welch Mining Company, San Francisco; J. H. Jellett, E. A. Selfridge, G. P. and E. H. Rixford, San Francisco, and J. T. Smith, El Dorado county; capital stock, $100,000, of which $60,000 has been subscribed.

The Good Title Mining Company, Nevada City; J. E. Poigndestre, E. J. de Sabla Jr., L. M. Hancock, Nevada City, J. J. Dailey, of Dobbins, Yuba county, and I. Joseph of Cincinnati; capital, $100,000, with $60,000 subscribed.

What Cheer Blue Gravel Mining Company, Oakland; J. M. Williamson, M. C. Rigney, W. H. Lee, E. C. Rigney and G. E. De Golia; capital stock, $100,000, of which $50 has been subscribed.

Ben Franklin Gold Mining Company, Grass Valley, Nevada county; M., M. S. and T. F. White, M. Laudy, P. H. Whelan, A. Burrows; capital stock, $100,000, of which $100 has been subscribed.

Recently Declared Mining Dividends.

The Swansea Mining Company, Utah, $10,000; payable October 10th.

The Mammoth Mining Company, Utah, $20,000; payable October 5th; a total of $1,110,000.

Wasp No. 2, South Dakota, $25,000; payable September 27th.

Iron Mountain, Montana, $5000; payable October 13th.

Morning Star Mining Company, Iowa Hill, California, $4 per share; payable October 5th.

Personal.

L. L. BAILEY of Denver, Colorado, left this city last Thursday on the China steamer for Corea, where he goes to look over the mines.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.

Operator and Dealer in

Mines, Mining Properties and Mineral Lands,

Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES.

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

EDWARD L. HALLAWELL,

115 and 117 Main Street (2nd floor),
SAN FRANCISCO, CAL.

Millwright and Engineer.

Contractor for the erection of Stamp Mills, Roller Mills, Reduction Works, Saw Mills (both circular and band), Aerial Wire Rope and Surface Tramways, etc., etc. Putting in machinery, shafting, etc., of all kinds promptly attended to. Estimates given on plants, complete, including machinery, building material, etc.

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

THE HARRINGTON & KING PERFORATING CO.
CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

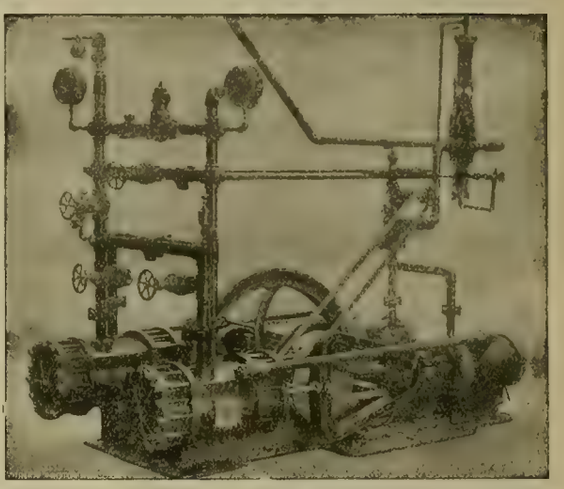
AND FOR USE IN

Milling and Mining Machinery	Stone, Coal and Ore Screens
Reduction and Concentrating Works	Stamp Battery Screens
Woolen, Cotton, Paper and Pulp Mills	Brick and Tile Works, Filters
Rice, Flour and Cottonseed Oil Mills	Spark Arresters, Gas and Water Works
Sugar and Malt Houses	Oil, Gas and Vapor Stoves
Distilleries, Filter Presses	Coffee Machinery, etc., etc.

Standard Sizes Perforated Tin and Brass Always in Stock.

Main Office and Works: 209 to 211 North Union Street, Chicago, Ill., U.S.A.
Eastern Office: No. 284 Pearl Street, New York

DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

DEWEY & CO.
AMERICAN AND FOREIGN PATENT SOLICITORS

FOWLER'S

Fossil and Asbestos Sectional Covering.

As a Non-Conductor, Unequaled.

Special Rates for Steam Boilers and Drums.

G. C. Fowler, 656-58 Howard St., S. F.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

QUICKSILVER!

FOR SALE BY

The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - 428 CALIFORNIA STREET, SAN FRANCISCO.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: There is some talk of the Lone Hill mine starting up again shortly at Oleta.

An eight-mule team drawing two large wagons loaded with machinery for the electric plant at Big Bar passed through Jackson en route for that place.

Republican: Those who are engaged in gravel mining in this vicinity have met with considerable encouragement of late. The indications for good pay gravel are better than at first supposed, and the outlook for good results from this branch of mining is very good.

Ledger: The double compartment shaft of the Pocahontas mine, near Drytown, is advancing at the rate of a set per day.

A movement is on foot by which it is expected that an English syndicate will take hold of the Pioneer of Plymouth property and sink the shaft 500 feet deeper. Operations are suspended pending the deal.

The work at the Zeila mine has been suspended in order that the shaft may be repaired. It is the intention of the management of the company to sink as soon as the repairs are completed and open out a new stope of 70 feet. When this is worked out it is possible that a new shaft will be sunk.

The Jackson Exploration and Development Company has succeeded to the property of the Jackson Gold Fields. They are to continue sinking on the Amador Queen and intend to go 500 feet deeper as rapidly as possible.

Butte.

Oroville *Mercury*: The Golden Queen mine recently bonded by the Stow company is developing some rich ore. It is free milling gold and the rock will be crushed at the Gold Bank mill, Forbestown.

Another strike is reported in the Denver mine at Forbestown, with plenty of ore in sight.

All the mines with the exception of the Old Flag are running with full force at Brown's Valley, and the Flag has only suspended operations for the present for the purpose of effecting a reorganization. This is about accomplished, and in a few days it is expected that work will be resumed. The Webb company are crushing rock from the Dannebroge and are also engaged in erecting hoisting works on the old Pennsylvania, preparatory to pumping and cleaning out the mine.

Calaveras.

Citizen: A large boiler for the Ford mine has been hauled from Valley Spring.

San Francisco people are operating the Sand Hill gravel mine at Camanche. A greater depth has been reached on the channel than ever before, showing 35 feet of pay gravel and the bedrock is not yet in sight.

The 10-stamp mill at the Fellowcraft is in readiness to begin crushing ore and the stamps will commence dropping the first of next week.

Thirty men are at work on the Melones mine, near Carson. The mine is under the management of W. C. Ralston.

The Gunter gravel claim at Washington Ranch has been bonded to Oakland capitalists and operations will commence immediately. This property embraces eighty acres of what was considered in early days the richest gravel channel in this part of the county, and, with the advantage of modern machinery, can be worked with great profit.

El Dorado.

(Special Correspondence).—J. V. Selby of San Francisco has bonded eighty acres of the Larkin ranch and the beginning of development work is already inaugurated. Mr. Selby was largely instrumental in starting the present organization of the Larkin Mining Company (incorporated), which after expending $20,000 has proven a good mining property.

R. M. Mooer has sold eleven claims, grouped under the name of Alhambra, to V. Hauser and H. E. Averill of San Francisco. Work has been started to pump the old shaft and push explorations upon the old drifts. This property was not worked below 100 feet and some drifting, and was fabulously rich, as proven by Banker Alderson's book records. The claims are about ten miles from Placerville, to the north, in the Kelsey district.

The Eagle King 10-stamp mill, one mile from Grizzly Flats, has started its machinery. W. Murdock, the superintendent of this property, together with Mr. Dyer, has an invention for a self feeder that is in use in this mill, a patent on which is applied for.

Placerville, Oct. 6, '96.

Inyo.

Independent: The silver and lead mining interests of Cerro Gordo, Darwin and Modock are practically at a standstill; all ore teams have been hauled off, shipments suspended and business generally is at a lower ebb than for many years past. Farther out, however, in the gold districts, there is considerable stir, indicating future activity.

Geo. Lewis has a working bond on the Wilson & Wibbelt property, near Mountain Springs canyon.

Across Panamint valley, in the Telescope mountains, the miners centering about Pleasant canyon have organized a new mining district under the name of South Park.

The late run of the Golden West mill, on ore from the Anthony mines, is reported to have resulted in a cleanup of about $7000.

Register: L. Chiatovich has begun to enlarge his cyanide plant near Gold mountain. Cyanide has done much for that section and it will do far more in the future. The company (L. J. Hanchett & Co.) has struck a large body of good milling ore in the bottom of the main incline at the Western Soldier mine. There is a great quantity of low-grade ore in sight in the Silver Peak district.

Kern.

Californian: The Rand Mining Company have let a contract, it is reported, for the erection of their 40-stamp mill inside of sixty days. It will be located about midway between Randsburg and Goler.

Both stamp mills at Garlock are working. A four days' run of one mill crushed forty-three tons of Randsburg ore that went $45 per ton.

Another strike has been made at Randsburg northeast of Mt. Olympus, on the Richardson claim.

A strike is reported from the mountains back of Kœhn springs, and sixteen locations have been made thereon. It is a succession of huge gold-bearing ledges that assay also in copper and silver. The ore is clearly a smelting proposition, and will have to be shipped until concentrators are put in at Kœhn springs.

Mariposa.

(Special Correspondence).—The absorbing news of the week is the well-authenticated report that the Mariposa grant has been definitely offered to the Exploration Company, Limited, of London. This is the corporation that fathered the South African gold fields, the Coolgardie mines of West Australia and the great dividend paying properties of Charters Towers in Queensland and introduced them to the British investing public. Senator John P. Jones is now on his way from the East to meet Hamilton Smith, the English expert, at San Francisco and escort him over the grant. During the past year many mining experts have visited the Grant and made reports, but it is reserved for Hamilton Smith, the highest salaried official of the Exploration Company, to make the final report. The Las Maripozas grant comprises about 44,000 acres on the direct line of the mother lode, and right in the heart of the mineral belt. The title to the property is derived under an old Spanish grant, which was acquired by Colonel Fremont for a song. After floating around the plains in the San Joaquin, Colonel Fremont finally located his grant in the Sierras and cast anchor at Bear valley. After spasmodic speculation, during which, as a sort of variety show, many actors made their bow, the grant settled down to a policy of masterly inactivity. The Princeton, Mt. Ophir, Pine Tree, Josephine and numerous other mines were all shut down—shut down at a time when they were paying well, because stock speculation in New York had collapsed. The greatest depth attained was at Princeton, and that was only a trifle over 600 feet. Between Mt. Ophir and Bear valley, some six miles of the mother lode, there has not been a pick stuck in the ground. If the London Exploration Company takes hold of the property, it is probable that it will make another Witwatersrand of it. The officials of the Exploration Company are nearly all Californians, and, after trying their wings in foreign climes and acquiring experience, they are getting down to the fact that their native State, along the mother lode, offers greater attractions to the gold seeker than anything that can be found outside of it.

The directors of the Merced Gold Mining Company have finished their inspection of the company's mines and gone back to Boston. They appear to be satisfied with their prospects and will submit a report to their shareholders recommending a policy of continuous development. The Merced Company have a capital of 100,000 shares of $15 each, $3 per share being still uncalled up. Recently a call of $2 per share was made, and the company has now about $200,000 at its disposal in the treasury. With this money the report of the directors will advise the shareholders to construct an electrical power system from the Tuolumne river. The power plant will be near Priest's hotel, below Big Oak flat, and about 11 miles from Coulterville. Another 60-head of stamps will be put up and the mill at the Potosi tunnel will be removed to Maxwell's creek, some distance below the Louisa mine. Captain Thomas Couch will re-assume the general management of the Merced Company's affairs.

At the Tendron mine, in the Whitlocks district, the Sierra Buttes Co., Limited, owners, the 20-stamp mill is running steadily. It is reported that the company has struck a shoot of rich ore.

Goodall, Perkins & Co. have a crew of men working at the lower end of Hunter's valley on the old Barretta mines. The proposition is a large one, so that it will take extensive tunneling to develop.

Charles E. Stuart, at the Doss mine, two miles from Hornitos, is now down about 850 feet. He is at present in San Francisco looking after more machinery.

The Mose L. Rodgers group of mines—the Washington, No. 9, Pool and Quartz Mountain—are preparing to start up.

In connection with the rumored sale of the Mariposa grant, several parties have recently been looking at the Yellowstone mine at Bear valley.

James J. Dolan has started work on the Story mine at the head of Indian creek near Date's Flat, at the top end of Gentry's gulch. The main shaft at the Story is down about 100 feet, and there is a tunnel and crosscut connecting with the bottom of it. Mr. Dolan, who was for years superintendent of the Mariposa grant, is sinking another 100 feet, and appears satisfied with the prospect.

J. B. Irving of Carlisle, England, has been inspecting the Farmer's Hope mine, Grove and Allingham owners, about seven miles from Mariposa. Mr. Irving has returned to San Francisco, taking samples with him.

A crew of men are at work on the aqueduct of the Mariposa Electric Power Co.

Capt. A. H. Ward is now at the Penon Blanco mine. He is still driving the tunnel from the west side to intersect the main lode.

The 5-stamp mill at the Laura La Grande, Macfarlane and Duncan owners, at Hazel Green, is working on $50 rock. Another five head of stamps has been ordered, and extensive exploration work is being done.

Dr. E. S. O'Brien of Merced recently visited his Mabel & Ethel mine on Saxon's creek, where development work is going on, and has gone to San Francisco to order additional machinery.

Coulterville, Oct. 6, '96.

Gazette: J. D. Ludwig has finished crushing Mariposa quartz. He has been using the mill at the Yellowstone mine. He reports that samples of the quartz went two ounces to the ton. Under his management they have just completed retimbering the Josephine mine.

It has been reported that the Yellowstone mine at Bear Valley has been bonded and work will be commenced very soon.

Mining seems to be looking up around Hornitos. They are now pumping out the No. 9.

There are twelve men working at the Dorse and reports are encouraging.

Miner: The Denver mine, near Haywards, owned by S. H. Haywards and James S. Johnson, is being examined by experts in the interest of an English company. There is about 200 feet of tunneling along a very large, well defined ledge said to carry $3·76 in gold.

Nevada.

Union: Some excellent ore has been taken out of the Pennsylvania mine. It came from the 600 level and was too rich to go through the mill.

A company represented by Charles Stepp has about completed arrangements for bonding the Mountain Chief mine in Willow valley. From present prospects it is expected that work will be begun at the mine in about six weeks. The property adjoins the Texas mine and there is a network of ledges on the property, all of which are supposed to lead into the main ledge. The shaft is about 110 feet in depth and there is a small hoisting plant on the mine.

Tidings: Captain D. S. Donohoe has erected a 2-stamp mill on his mine in the Washington district.

The Omega dam is to be rebuilt.

Transcript: The full complement of forty stamps in the mill at the Providence mine were started up last Monday and the full force of miners are at work again. The mill has been thoroughly overhauled and will be kept running at its full capacity, there being an abundance of good ore in sight.

The Champion Company are preparing to begin work in the old Merrifield mine, which property they now own.

Operations have been resumed at the upper hoisting works of the Reward mine. The lower hoisting works, which were put up to facilitate driving the drain tunnel, are still being operated.

Placer.

Colfax *Sentinel*: The Mayflower Company have made an upraise into what they believe to be an extension of the old Paragon lead.

O. J. Spencer of Iowa Hill has sold the Big Gun mine at Michigan Bluff, which includes the Van Eman and Red Hill patents. The parties making the purchase are J. and E. Powell, G. Hill, N. Huff, W. Locey and E. S. Thompson.

A vein of quartz 2 feet in thickness and bearing free gold in considerable quantities has recently been discovered in the Sailor gravel mine at Sailor canyon. The company have commenced an exploring tuunel to develop the ledge. The work of exploring the channel or old river bed is progressing steadily. At present the main gangway is being driven ahead and is in about 1700 feet.

Bids are asked for raising the Liberty Hill dam across Bear river, near Dutch Flat. When the work is commenced the Liberty Hill and Polar Star hydraulic claims will be operated.

Some very good gravel has been taken from the Breece & Wheeler mine at Bath. There are 14 men at work.

Plumas.

Plumas *Independent*: Work has been resumed on the prospect shaft of the Verdi placer claim on Mill creek.

Shasta.

Free Press: A company of English capitalists, who have been operating in Mexico, have made extensive repairs to the Afterthought mill, near Furnaceville, and have put in a smelter of thirty tons capacity. One thousand tons of ore have been taken from the Donkey mine, and a contract to haul the ore to the smelter has been awarded.

The Integral Quicksilver Mining Company have put a large force of men to work cleaning up and further developing their property.

The Altoona mine is being run at its fullest capacity. About 650 flasks of quicksilver, valued at $26,000, are produced monthly. The company gives employment to over 350 men, 65 of that number being underground miners.

The success of the smelting plant of the Mountain Mines, Ltd., at Keswick, has stimulated the mine owners of Old Diggings to greater activity, as great quantities of ore will be required as flux for the smelter.

The Garfield mine has a force of eight men employed in development work.

The Hart mine and mill are being run to their full capacity.

A large force of men are employed in getting out ore at the old Central mine.

Sierra.

Messenger: The Jamison Mining Company are pushing work on their mill. Quite a supply of good ore is out and the showing in the mine is said to be good.

The Four Hills mine will soon begin crushing ore. Already 400 tons of good ore are ready for milling.

No. 9 mill is being repaired and will soon be in readiness to crush ore from the Bigelow mine. Quite a force of men are employed, and it is reported that rich rock has been struck.

Last week $15-ore was struck in the American Exchange mine, in Hog canyon. The ledge is 12 feet wide.

Siskiyou.

Yreka *Journal*: The owners of the Shinar mine, Leadville people, have contracted for hauling freight from Yreka to the mine, including 80,000 pounds of pipe and two cables weighing each 34,000 pounds, for use at their new mine. The ditch which they have been building is about completed, and this pipe will be used to carry the water across the Klamath river, and will be suspended by the large cables. This will be one of the most extensive plants in the northern part of the State when in operation.

A number of quartz ledges in Quartz valley and in the vicinity of Oro Fino have been in operation this summer, and most of them have been paying very well. Together with the extensive hydraulic mines which run a greater part of the year, that is one of the most successful mining localities in the county.

Reporter: Shorbs, Brunt & Co. are again taking pay gravel from their drift mine below French Bar.

Martin Andrews and son are working their drift mine underneath the bar, on which stood Simonville, a flourishing town, in early days, but no trace of which is now visible to the passing stranger.

The Chinese company on Michigan bar have before them a large body of ground. This is, perhaps, the most valuable mine on Scott river to-day.

Yreka *Journal*: The Mabel mill, near Scott Bar, will be started up soon and the owners will begin crushing ore from the Mabel mine immediately. They have over 200 tons of rock out. The last crushing went over $20 a ton.

The ditch which the new mining company on Thompson creek is building will be one of the best ditches ever built in the county. It is giving employment to about fifty men.

Tuolumne.

Union-Democrat: The pocket miners, who find their busiest time during the winter months, are already beginning to arrange for starting work on the hundreds of prospects that have been more or less idle for some time.

The usual rumor that Whiskey Hill will be started is again being actively circulated.

At the Dutch the new hoist is completed. Preparations are being made to add the 10 new stamps to the mill.

Over 75 men are employed on the Shawmut and Eagle mine. Two new shafts have been started; the one on the Shawmut end is down 125 feet and the one on the Eagle end only started last week. The intention is to sink them 1000 feet.

At the Confidence, preparations to build the new 30-stamp mill are well under way. It will be run by electricity, which will be generated but a short distance from the mine.

At the Alabama the shaft is down 107 feet. When it reaches a few feet more a station will be cut on the 100, and levels driven north and south on the ledge. During the winter the work of sinking will be continued and stations cut every 100 feet. The intention is to have the property opened up by the early summer of 1897 so that the Londoners interested will be able to judge for themselves the value of the claim and the scale upon which they wish to work it.

James Gloster, an old Montana prospector, recently discovered a valuable ledge of high-grade ore near the old Buchanan mine. He has already refused an offer of $20,000 for a one-half interest. He claims to have eleven feet of ore that will average $15 per ton, which in this section is an extravagant claim, though the abandoned Buchanan mine in that immediate locality was a bonanza producer. The new find is the theme of general conversation.

At the Arbona mine, owned by the Equitable Mining & Milling Co. of Stockton, the crosscut tunnel will soon be completed, after which drifting each way along the ledge will be done for the purpose of ascertaining the length of ore chutes. There is a large amount of ore in the ledge showing along the surface for a distance of more than 500 feet.

During the week seven men were laid off at the Mammoth mine. There is a feeling of uncertainty existing as to the future operations of the company.

The cleanup at the Jumper mine is increasing each month in value. The amount of bullion being produced monthly now is from $150,000 to $200,000. The ore continues to hold out both in richness and quantity.

Independent: W. H. Storms who has long been connected with the State Mining Bureau is to open up the Junction mine shortly. The Junction mine is an extension of the Live Oak and is capitalized for $100,000. Mr. Storms will be the superintendent. His associates are Chas. G. Yale, H. S. Durden, W. A. Hall and R. S. Clark.

NEVADA.

The citizens of State Line district are awakening to a new era, owing to the big strike in the new tunnel that is being run under the old mines near Austin. The projectors of the tunnel have struck ore that gives 1000 ounces in silver to the ton. A 20-stamp mill is being built to work the ore. The ore is of a rebellious character and will be hard to work, but the management expect to extract nearly all of the silver.

The Keystone Mining Company, near McClosky creek, have built a new bridge over the creek and a wagon road to the mine. Machinery for the new mill is arriving, and the company expect to have the new plant, which will be of ten stamps, in running order before snow flies. The company have about 16 men employed at present.

Winnemucca *Silver State*: The Bray brothers of Austin, Nevada, are putting up a mill in Ione district, where they own a gold mine.

OREGON.

Democratic Times: Hale Bros. & Co. of Leland are constructing a seventeen-mile ditch

to their Grave creek placer mines, and will operate on a large scale this season.

Alex. Watts is building a five-mile ditch from Munger gulch to his Horsehead diggings in Williams creek district.

C. L. Mangum and his associates are prospecting a large bar in the western part of the county. They claim 57 feet of pay gravel which will average from 25 to 40 cents per cubic foot.

Favorable reports continue to come in from the Oregon Bonanza mine in Williams creek district.

J. A. Leonard, H. A. Stevens and others have located several claims on a ledge of free-milling quartz which they recently discovered on Soldier creek, Josephine county.

The Hampton-Lewis Mining Co. of Grave creek have thirty-five men employed digging ditches and repairing flumes.

C. E. Phillips and Walter Strong will put an extensive hydraulic plant in Allen gulch, Althouse district, and rebuild the Darkas & Quinn ditch to supply water.

It is announced that the Squaw Lake Mining Company, which is now cleaning up, will temporarily suspend operations after this week.

O. G. Shurtleff and Ed. Sikes of Portland, who with B. A. Haney and H. H. McCarthy bonded the Blatt ledge on Flarmer's Flat, have completed nearly 100 feet of tunnel.

WASHINGTON.

Spokesman-Review: Arrangements have been completed to commence work on the property of the Comstock Mining and Smelting Company in the Le Fleur district.

In Okanogan county a company was formed some time ago, with a capital of $5,000,000, to tunnel Palmer mountain and it has begun work. The tunnel begins on the first bench back of the town of Loomiston. It is proposed to run it 3000 feet to begin with, which will give a depth of 1100 feet in the face and take the tunnel half way to the Grand Summit mine. There are twelve other known veins on the line of the tunnel, all of which carry free-milling gold ore, some of it being very high grade. When the tunnel is completed to the 3000-foot station it will be within a few feet of the east end line of the Black Bear and War Eagle mines, which have already produced over $100,000. These two mines are the only properties on the line of the tunnel which the tunnel company does not own or control.

BRITISH COLUMBIA.

Spokesman-Review: The Idaho mines in the Slocan have declared a dividend of $20,000 and expect to declare regular dividends of from $15,000 to $20,000 a month from this on. This company has paid over $60,000 in dividends in the past. Ore to the value of $35,000 was taken from the mine last month. The concentrator is handling 350 tons of ore a month, the concentrates of which will run 200 ounces in silver and 45 per cent in lead. The crude ore, of which 50 tons are taken out monthly, will run from 250 to 320 ounces in silver and from 50 to 65 per cent lead.

An important strike has recently been made on the Bluebird mine, in the Slocan. The strike is on a new vein, which is from two to four feet wide, and assays from the ore run as high as 270 ounces in silver and 50 per cent lead.

J. L. Drumheller has sold his Rabbit Paw claim, in the Slocan, to F. T. Kelly, one of the owners of the Reco, for $5000.

The new strike of free gold on the Maud S., in the Waterloo camp, continues to be the absorbing topic on the streets.

The Evening Star is now making daily shipments of 20 tons of ore to the Trail smelter.

A new discovery has recently been made on Observation mountain on the Gold Nugget claim, near Grand Forks. The formation is rose quartz in granite, the assays of ore from a depth of six feet running well in gold. The ledge is over 40 feet wide and lies between well-defined walls of granite.

An agreement was recently made between Robert Clark, owner of the Seattle mine, and Charles Hay and Neil McCallum of Grand Forks whereby it was agreed to stock the property for $6,000,000.

Another strike has been made in the Evening Star mine near Rossland. The strike was made in the lower tunnel, and uncovered a body of four feet of ore.

Rossland *Miner*: Charles Bates and partners have sold the Little Giant group to a Seattle syndicate represented by Captain O'Toole for $10,000 on a six months' bond.

An option has been taken on the Surprise by a French syndicate for $50,000. It lies up on the east side of Red mountain, comprising about 45 acres, adjoining the St. Louis.

The Reco group, consisting of the Reco, Texas, New Denver, Clifton and Ephraim, has been incorporated under the provincial laws with a capital of $1,000,000 in $1 shares.

Spokane *Chronicle*: Several properties on Stoney creek, two miles north of Rossland, are being developed, and the work discloses heavy ledges of ore similar in character to those on Red mountain and Monte Cristo.

Baltimore and New York capitalists have purchased the Carbonate King group of four claims, lying near the No. 1 mine at Ainsworth. Development work on this property will begin immediately and continue all winter. They are understood to be figuring on the properties.

The Evening Star mine at Rossland has begun to ship ore, and hereafter about twenty tons per day will be sent to the Trail smelter. The ore is averaging over $40 per ton, and shipments will be increased as rapidly as possible.

The Gopher, in the south belt, has been bonded to an English syndicate for $50,000.

ALASKA.

News: Over 200 new mining claims have been filed for record in Harris mining district since the first of the year.

The Julian Mining Company have made their first cleanup and the management is more than gratified at their success.

UTAH.

Salt Lake *Tribune*: The Grass Creek Coal Company has incorporated with a capital of $200,000. The company owns the Cullen Springs coal mine and appurtenances, together with 500 acres of coal lands in Summit county.

The Sacramento has started up its mill with ten new tanks and a capacity for handling 100 tons daily.

The State Line Gold Mining Company has incorporated with a capital of $200,000. The company owns a group of claims in the State Line mining district in Iron county.

The shaft on the Wonder has now reached a depth of nearly 450 feet.

S. D. Colton & Co., who have been working the Big Four copper mine, near the Dyer of Victoria, have put out over 100 tons of copper.

The fact that Silver King is now marketing its ores at the rate of about 500 tons a week, and this in the face of a recent announcement that no more dividends would be posted until there was an advance in the metal market, has excited considerable speculation among local brokers, a majority of whom express the belief that dividends will be renewed in November, if not the present month.

The Mercur Company broke all previous records during the month of September. With a force of 115 men Superintendent Edwards mined 7000 tons of ore; and the mill, being constantly supplied with the exception of a few hours, also broke its record and treated the entire amount, which would be an average of about 235 tons daily.

It is reported that a contract has been let by the Bullion-Beck Tunnel Company for driving their Mammoth tunnel 400 feet farther into the mountain.

At Tintic L. E. Riter and C. E. Loose have taken up their bond on the Elmer Ray and will shortly commence vigorous development of the property. They have been engaged for the past month in clearing up the old workings and have the property in good shape.

Although the backers of the project decline to release particulars at this time, it is well known that the plans for the big tunnel that is to tap the mines at Alta have about crystallized, and that work will probably be begun in a very few weeks. As previously announced, the plan is to make the tunnel serve a double purpose. In the first place no attempt has ever been made to explore ground below the water level at Alta, in that it involved the use of heavy pumping machinery, while a drain tunnel will overcome this and throw the ground open to economical development. Again, a tunnel such as is projected will afford a permanent outlet at all times of the year for the ores of that camp, whereas the season in which ores may be handled at present is six months at the most.

A letter received by the officers of the company brings tidings of a new strike in the Four Aces at Silver City.

Tribune: The Mammoth mine is now lighted entirely with electricity that is generated across the gulch, and in the mill.

The management of the Hoogley at Bingham is making arrangements for a gasoline plant on that property.

The New Hawkeye Mining Company has incorporated with a capital of $100,000 to work a group of five claims in Wasatch county.

At Silver City the Swansea ore body has continued to improve in quality as well as quantity.

The Gold Point Mining Company has decided to resume work, and to that end a contract has been let for 100 feet of drifting upon the dip of the vein. The group of claims embraced in the company's possessions are located in Ferguson gulch, off Big Cottonwood. Upon the property the shaft has already been put to a depth of 75 feet, at which point the vein is 38 feet between walls.

IDAHO.

On the "island" east of Market lake placer mining is being done. In mining, the soil is scraped off, and then the gravel is washed in the old-fashioned rocker, in which burlaps are placed to catch the fine gold. Some 40 to 60 men are engaged in this class of mining, and they estimate the average earning per day at about $2 for each man.

Recent rich strikes in the Florence mining district are causing much excitement in mining circles.

Avalanche: At the Trade Dollar a complete electric light and power plant will be put in at once. The output for September will be about $115,000.

A rich strike has been made in the Poorman, in a crosscut from the lower tunnel.

MONTANA.

Mining and Railway Review: A. L. Tanner has struck a rich tract of placer ground a few miles from Red Lodge. A single pan of gravel from his diggings is said to have yielded as high as $5.

A 20-ton smelter is to be erected at Princeton. Preparations for the work are already under way. Water power for the operation of the plant is to be secured from the Big Spring.

Inter-Mountain: H. L. Frank and E. L. Whitmore have secured the Gem and a fraction known as the Stuart, north of the High Ore, on a bond of $45,000, and are now putting machinery in position to work the ground.

The Mat mine, in Meaderville, which has been lost sight of for a number of years as a producer of copper, is now being prospected. Lately the shaft has been developed an additional 200 feet, making its total depth 400. Regular shipments of copper-silver ore are being made, but not in large quantities.

The Pauper's Dream Mining Company, above Rimini, will resume operations after a shutdown of many months. Since the mine and mill closed down the company have expended considerable money in improving the one and developing the other.

The second payment of $100,000 has been made on the purchase price of the Diamond Hill mine, recently sold to Glasgow, Scotland, capitalists. The purchase price is $2,000,000, more than half of which is to be paid in cash, the balance in stock in the new company. The company will at once begin the erection of a 60-ton mill, which will cost about $200,000.

During the past week a number of experts have visited the Minnie Healy, near Meaderville, and made an examination of the workings. It was reported that the Colorado company had secured an option on it for $150,000, but this is denied.

The Ruby Placer Mining Company, operating on Wisconsin creek, have about completed their extensive scheme of development, which consists of a bed-rock flume one-half mile in length, a substantial reservoir, several miles of ditch, a system of electric lights, etc.

Report is current that a new 4-foot chute of $40 ore has been exposed in the Leiter.

Work on the Old Faithful mine at Bannack, in which a rich gold strike was made some weeks ago, has been suspended temporarily owing to a misunderstanding between the company and the miners. The mill is running regularly and, it is said, with very satisfactory results. A few weeks ago a cyanide electric plant was installed.

The reports received from the Beef Straight and Homestake districts are very encouraging. W. Huselton, who bonded the Black Sheep to W. A. Clark of Butte for $26,000, says that the Black Sheep is looking better now than at any time in its history. It is the deepest mine in the district, the ledge being tapped by an 800-foot tunnel 250 feet from the surface.

SOUTH DAKOTA.

Black Hills *Miner*: Another discovery of high-grade gold ore has been made on the Union Hill property in Galena camp, that assays nearly $100 per ton.

A shoot of siliceous ore has been uncovered in the 100-foot tunnel on the Hudson group of claims.

The Lead *Call* reports that an ore shoot 4 feet thick, assaying $80 gold per ton, was recently encountered in the workings the of Durango mine, on the Poorman divide.

A shoot of siliceous ore has been encountered in the workings on the Granger group north of Portland.

The main tunnel on the Deadbroke group on Blacktail gulch, is now in over 1500 feet, the last 200 feet having been driven under the ore body.

Another discovery of high-grade siliceous ore has been made in Ragged Top camp, on the Norwich lode. As the same vein is opened to the southeast, on the Dacey ground, its course and continuity are now proven.

The new ore shoot recently encountered in extending the main tunnel, now in about 500 feet, is proving to be one of the largest yet found on the Poorman divide. It is fully 7 feet thick and has been drifted into for 14 feet and is solid clean ore.

The report of the secretary of the Wasp No. 2 shows that 22 carloads of ore were shipped to the Kansas City smelter during the month of August, the gross returns from which amounted to $32,504, an average of $1482 per car. All of this ore was taken out in running a drift 70 feet long and 10 feet wide in the ore body.

A large body of silver-lead ore of an average value of $16 per ton is exposed in the workings in the Joe Hooker lode, owned by the Yankee Boy Mining Company, in Carbonate camp. The face of the workings show a solid breast of ore 5 feet thick and 13 feet wide, resting on quartzite.

Black Hills *Times*: The Keystone Mining Company will soon put in the machinery for the new cyanide plant, intended to treat the concentrates from the stamp mill.

During the past few weeks the vein in the St. Elmo has rapidly increased in size, and is now fully 7 feet in width at a depth of 45 feet.

The lessees of the Iowa and Brunette lodes, situated at the head of Poorman gulch, have encountered a body of high-grade cement ore in the old workings that shows considerable free gold.

WYOMING.

Edward A. Green has completed arrangements for the purchase of a large placer mine near Lewiston, Fremont county. The purchase price is said to be $90,000. Mr. Green bought the property for Eastern capitalists.

Reports from Grand Encampment are very encouraging as development progresses.

Chicago investors, who several months ago gave a bond of $12,000 on the Virginius mine in the Keystone district, near Rawlins, made the first payment of $4000 on the property on October 1st, having decided that the mine is a paying proposition.

The machinery for a complete cyanide plant to be placed at the Kelly creek mines, five miles from Buffalo, is being freighted in. The ore averages $3 a ton and the plant will work about 120 tons a day.

COLORADO.

Cripple Creek *Mail*: A big ore house is being erected near the mouth of the shaft of the Granite mine on Battle mountain.

The Rhyolite Mining and Milling Co., which owns three claims on the south side of Little Bull, have resumed operations on their property with a full force.

The Putman brothers have sold their Pointer mine on the southwest spur of Gold Hill to an Illinois syndicate for $40,000.

Estimates place the output at present of the district not far from 600 tons daily, the average value of which is $60 a ton. From the present indications the output for this year will exceed last by $1,000,000 or more.

The sensational strike made on Buck mountain in the Veritas is described as nothing less than a 4-foot vein which is all ore running from $300 to $400 per ton and carrying a 4-inch streak of sylvanite.

The Anchoria-Leland company will ship a greater tonnage this month than any month in the history of the mine. The output last month exceeded in gross value $45,000.

Shipments at the rate of 25 tons a day are being made from the Ironclad. The output figured $38,000.

The production from the Independence mine for the month of September is now placed at 800 tons. The ore is going to the smelters and the value is roughly estimated at $100 per ton. The Peck mill has been started up.

The Gold Coin Company has lifted the bond of $55,000 due the Mount Rosa Company for the Gold Coin mine, which has been developed in the past few months into one of the best producers in the district. The bond was not due until October 14.

A bond and lease has been executed by the Squaw Mountain Mining and Tunnel Company to R. M. Maloney, Lyman White and associates, the lease being for two years and the bond calling for $200,000.

ARIZONA.

At the Congress mine, Arizona, the shaft is now down 1800 feet, and four miles of tunnels, drifts and other underground work have been run. About 355 men are employed, and the output of the mine is said to be about $80,000 per month.

Globe *Silver Belt*: The Cliff mine, which adjoins the Dime and is bonded as a copper claim to the United Globe mines, bids fair to become a silver producer, for which it was originally located.

The result of tailings treated at Harqua Hala for the month of August is: 4197 tons; bullion yielded, $11,812; expense on revenue account, $6,550; profit for month, $5,262.

Yuma *Sentinel*: Dr. Jayne writes under date of Sept. 20th, from New York. "Senator Dorsey and associates have purchased my group of mines, the Mars, Venus, St. George and Goshen, at Picacho for $250,000."

The Golden Dream Mining Co. is crowding the work with 25 men on its six shafts and two tunnels with excellent results. There has been a steady improvement on the quantity and quality of the ore bodies.

The Golden Dream Co.'s mill will be ready to ship on the 8th. The company will crowd the work on its other mines as fast as men and money can do it. It has already given orders to have the work pushed.

Adolfo Sambrano has struck ore rich in free gold, visible to the eye.

Villa Bros. have struck it rich in their tunnel on the Golden D. K. mine, taking out the richest ore ever found at Picacho. This vein has been crosscut for 54 feet with neither wall in sight. This tunnel and the Sambrano shaft are both about within 1,000 feet from the Golden Dream mill.

Mining News: At Harshaw, Richard Farrell has 40 men employed on the Old Trench. Sometime ago, in the process of development, a lake of sulphuric acid was encountered. Tools were eaten up and quite a loss occurred through the discovery of the unexpected deposit. The acid was finally pumped out, however, and work continued.

AUSTRALIA.

Mining Standard: The following is an analysis of the results of the Croydon Quartz Crushing and Gold Mining Company's cyanide operations. It shows the cost of treating low-grade tailings at the largest works of the kind yet run in Australia:

Duration of run (working days)	469 days
Corrected dry weight of tailings leached	37,387 tons
Weight of tailings leached per day	79.7 tons
Percentage of acid in ore	0.24
Water to remove acid per ton of ore	174 gallons
Average leaching rate (water and solution) per hour	0.93 inches
Weight of bullion recovered	36,731.1 ounces
Weight of fine gold recovered	8 21 2 ounces
Weight of fine silver recovered	26,700.6 ounces
Cyanide consumed per ounce of bullion recovered	9 pounds
Zinc consumed per ounce of bullion recovered	0.36 pounds
Strength of cyanide solution	0.2 per cent
Percentage of tailings	0.08 per cent

	Gold. Dwts.	*Silver. Dwts.*
Assay of tailings before treatment, per ton	6.45	30.45
Assay of tailings after treatment, per ton	1.49	16.41
Extraction called for per ton	4.96	14.04
Recovery, per ton	4.41	14.31
Recovery, per cent	68.3	46.9
Average fineness of bullion	.2243	.7275
	£ *s. d.*	*s. d.*
Average value of bullion, per ounce	0 19 0 65	1 2.64
Assay value of tailings per ton	1 7 4.77	2 7.97
Recovered value of tailings per ton	0 18 9.01	1 2.58

COST OF TREATMENT.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

CALIFORNIA STUMP PULLER.

This is a photograph of the Stump Puller at work on redwood stumps on the farm of C. E. Ogburn, Guerneville, California.

In the improved form in which it is now offered to the public, it is universally admitted to be the most practical, powerful and successful machine of the kind in America, and the only machine in existence that can be successfully operated on hill land.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City.

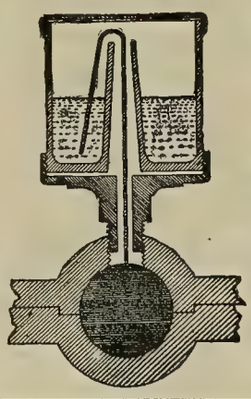
Positively Reduces Oil Bills 75 Per Cent.


THE FINCH OIL CUP.
Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.
During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

K. J. McHUGH, 51 Fremont St., San Francisco, Cal.
General Agent for Pacific Coast. Send for Circular.

HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { **Brown's Complete Automatic Mill Process.** **Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.**

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.

The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.

Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 8, 1896.

Business in all branches of trade continues good with the buying outside of winter stocks, confined to nearby wants. The strength of wheat and a better general average price for other farm products have a beneficial effect. If crop advices regarding wheat are correct then good prices, higher than for several seasons, will rule this winter and next spring. With this the case it will have quite a favorable influence on business particularly with a continued boom in gold mining. The opinion prevails that after election there will be much better times in business circles, without regard to who will be elected President. This opinion is largely based on the fact that stocks of goods, for the season, are light while consumers have been buying sparingly, fearing that there might be a panic. Whenever the latter is expected and prepared against, experience has taught that it does not come.

The local money market is still working easier, with better accommodations given at commercial banks, but the savings banks are still working close and will continue to do so until after election. It is stated that collections are fair to good, while the banks and sub-treasury have a considerable surplus of funds in hand. More gold is on the way from Australia, with other shipments expected to follow. The movements of crops have called for considerable money; but, with free outward shipments, it is again coming back into regular channels.

Eastern mail advices are to the effect that there is a steadily growing ease, although the scarcity of berth room for shipments to Europe is somewhat against it. The *Wall Street Journal* says that time money is in better supply at 6 per cent; but borrowers, as a rule, do not wish accommodations longer than until after election. The Government has been disbursing over $5,000,000, which has had a favorable influence, as also other liberal disbursements at financial circles. At New York there is a growing feeling that the importation of gold may slack off for a short time, owing to an advance in bank rates and close money markets abroad.

It appears that the Continental demand for gold in the London open market and at the Bank and the demand for gold to move the Egyptian cotton crop were quite as powerful factors in determining the Bank of England directors on an advance in the discount rate as the American demand. Berlin has steadily drawn gold from London both on Austrian and Russian account. Exchange rates favor the operation as far as Germany is concerned. How much gold has gone to Austria and how much to Russia is not known, as it is going through Berlin, on which both Vienna and St. Petersburg are apparently drawing. The Austrian demand is explained by the fact that credits created by former loans are not exhausted, while Russia as is known always keeps large credits at Berlin and London. Austria's delay in fully resuming specie payments is causing doubt as to the entire success of the operation. The Austro-Hungarian Government has to meet large interest demand on her foreign debt every year, which is, apart from politics, the chief obstacle to complete resumption.

New York Silver Prices.

NEW YORK, Oct. 8.—Following are the closing prices for the week:

	—Silver in— London.	N. Y.
Friday	30 5-16	65⅝
Saturday	30 5-16	65⅝
Monday	30 5-16	65⅝
Tuesday	30⅛	65⅝
Wednesday	30	65
Thursday	30	64⅞

	Copper.	Lead.	Iron.	Tin.
Friday	10 65	2 75	10 25@12 25	12 80
Saturday	10 65	2 75	10 25@12 25	12 80
Monday	10 65	2 70	10 25@12 25	12 75
Tuesday	10 65	2 70	10 25@12 25	12 70
Wednesday	10 65	2 70	10 25@12 00	12 65

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	02½
New York Telegraphic Transfer	05
London Bankers' 60 days	$4.84
London Merchants	$4.83
London Sight Bankers	$4.86
Refined Silver, per oz., 1000 fine	64⅞
Mexican Dollars	50½@51½

SILVER.—The market went off towards the close of the week, with a weak closing. At the decline it is stated that considerable is coming out at the East and abroad, which may cause still lower prices. At the declining prices it is said there has been concentrated buying by strong parties. If this proves correct, then much better prices are apt to rule when the selling pressure is well over.

Pixley & Abell report shipments of silver from London to the East from January 1 to October 1 as compared with the corresponding period of last year as follows:

	India.	China.	Straits.	Total.
1896	£2,893,778	£574,413	£545,686	£4,013,877
1895	3,980,615	2,119,573	949,946	7,050,234

The above shows quite a falling off. Where the bullion that has been extracted has gone is a conundrum. Unless the arts and other Governments have more this year than last, it must be in speculators' hands.

MEXICAN DOLLARS.—The market is quiet with buyers favored at lower prices in sympathy with a decline in silver.

COPPER.—The market has sold to lower prices under more competition selling. The consumption in this country is only fair but abroad it continues large. It is stated that the United States will soon begin to take more freely.

The market is quoted as follows:

Ingot, jobbing	—@13½
Ingot, wholesale	—@12½
Sheet copper	—@16½

LEAD.—The market has eased off slightly under more offering at the East with consumers fairly well stocked.

Our market is quoted as follows:

Pig	—	@	3 60
Bar	—	@	3 95
Sheet	—	@	5 25
Pipe	—	@	4 50

ANTIMONY.—The demand is fair, with the market steady at 7¾@8⅛c in a jobbing way. New York mail advices quote 7⅜ for Cookson's, 6⅝c for Hallett's and 6½c for Japanese, from store.

BORAX.—The movement Eastward continues quite free.

The market is quoted as follows:

Refined, in car lots	6⅛
Refined, in sacks	5⅞
Powdered, in car lots	5¼
Concentrated, "	5⅝

QUICKSILVER.—The market is steady at quotations.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

SHOT.—There is nothing new to report.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do. " "	1 45

TIN.—The markets are still lower, being unfavorably affected by lower prices for silver. There is very little inquiry.

Pig, per lb		13½
Plate, I C coke, heavy, per box	—	@4 05
" " " light, "	—	@ 3 95

POWDER.—There is a continued free demand.

The market is quoted as follows:

Hercules, No. 1, per pound	11½c
No. 2, " "	8½c

IRON.—Eastern mail advices are as follows: The feeling in the iron trade is steadily improving. We cannot hope to reach normal conditions until the currency question is definitely settled, but it is gratifying to note a rise in the tide. In the Chicago districts, some large inquiries are in the market. One of them calls for a block of from 6,000 to 15,000 tons of Bessemer. Bessemer pig has advanced to $11 in the valleys as the asking price for delivery next year. In bars and merchant steel, contracts are more liberal. Pittsburg reports from 7,000 to 8,000 tons to be closed at an early date. It is believed at Philadelphia that the mills next year will have all the business they can handle. The price of pig iron at St. Louis has improved about 50 cents a ton in the last thirty days.

Our market is quoted as follows:

AMERICAN.

	To Arrive.	Spot.
Sloss	$21 00	$23 50
Thomas	22 00	23 50
Salisbury	30 00	33 00

ENGLISH.

Barrow	$21 00	$23 50
Gartsherrie	21 50	23 50

Bolt.....¼ & 5-16, 20c; ⅜ and larger, 17c
Lake Superior Sheathing..... 20

COAL. — The market is essentially unchanged since our last week's issue. For shipments the feeling continues easy.

SPOT FROM YARD—PER TON.

Wellington	$7 50@ 8 00
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 00@ 5 50
Coos Bay	—@ 4 50

Mining Share Market.

SAN FRANCISCO, Oct. 8, 1896.

The market held to low prices under light business up to Tuesday, when a better tone set in, and with more active trading there was an advance at the day's closing of from 10 to 30 per cent on Saturday's prices. Yesterday (Wednesday) business was fair in the morning, but fell off as the day passed. The closing was very quiet. The better-informed are outspoken in the belief that it is a freeze-out, not by the small pools but by the moneyed inside. They say that this opinion is warranted by the work that has been and which is being done in the mines on the Comstock lode. It is stated in better-informed mining circles that within the past few months two or three quite important ore strikes have been made, but, owing to the share market not being in the best condition for securing several large holdings, the finds were ignored and no mention made of them, while the work was either turned or else stopped. These reports are given for what they are worth, yet the strong depression of the share market, the levying of assessments and mining secretaries crying hard times, seem to give color to them. Manipulators do not sell when everything is made to look bad, but they buy. They only sell on an active and advancing market and on reports of ore strikes. This is the history of the Comstock mining share market, and will continue to be so long as there is gambling in them. There is a continued scarcity of shares for shorting the public, which is accepted by operators of lower prices so as to gather in more from outside holders scared into selling. The inside do not want short sellers interfering with their freeze-out game by buying when the market is sent lower through cross-orders, fair to poor mine reports and levying assessments. It is a great game, this. Dealings in the Bodies have been light, with very little variations in prices.

The following mining companies report cash on hand October 1: Alta, $171; Alpha Consol, idated, $8830; Best & Belcher, $14,977; Belcher, $15,989; Bodie Consolidated, $534, with $3602, of unsold bullion; Bulwer Consolidated, $4479, with $6430 of unsold bullion; Bullion, $8213; Caledonia, $4190; Confidence, $6151; Chollar, $15,048; Consolidated Imperial, $3456; Consolidated California & Virginia, $14,816; Church, $6858; Challenge Consolidated, $157 and owes money at bank; Consolidated New York, $1274; Crown Point, $13,002; Exchequer, $1846; Gould & Curry, $2185, with $5000 due on the company's note at the Nevada Bank; Julia Consolidated, $41; Hale & Norcross, $472, and 90 tons ore valued at $1500; (due the bank $3000); Mexican, $3382; Mono, $1633; Overman $5565; Ophir, $1679; Occidental Consolidated, $939, with $5500 due the Nevada Bank and expenses of the mine for the past month unpaid. The greater part of an assessment of 10 cents per share is to be collected, and the proceeds of 15⅓ tons of concentrates, valued at $149 per ton, are to be received. Potosi $139; Savage, $4; Silver Hill, $795; Sierra Nevada, $21,954; Summit, $410; Segregated Belcher, $529; Standard Consolidated, $22,597, with bullion and concentrates valued at about $11,000 in transit; Silver King, $588; Syndicate, $700; Union Consolidated, $16,434; Utah Consolidated, $351.

Lady Washington has no cash on hand and owes $327.

From the Comstock mines there is nothing new to report, so far as official letters go, but private advices are of a more encouraging character, yet in operating it is not safe to be governed by the latter even if they are thoroughly correct for insiders having control at the mines and in San Francisco can carry out any plan desired by them. In Alta the management appears to be avoiding striking ore in the Keystone ledge, probably in hopes of freezing holders out of their shares. In Overman the work is about as heretofore reported. Some ore has been milled which returned something over $2700 gross. Seg. Belcher milled some ore which yielded gross about $2400. The work in this mine is essentially unchanged. Belcher raised the past week 60 cars of fair grade ore. In Crown Point work is continued in several levels. It is said that if the management desires considerable good to high grade ore can be shown up. Nothing comes from Kentuck or Yellow Jacket regarding work. It looks as if shares, and not ore, are wanted. Confidence milled some ore which gave a gross yield of over $1600. The work is practically unchanged. In Con. Imperial the work is continued in the joint Challenge, Confidence and Con. Imperial crossdrift and also in the west crossdrift No. 3. They ought to find some ore before long, provided they want to. In Alpha they are still working west on the 500-level. They do not appear particularly desirous of showing up the good to high grade ore known to be in that direction. There is no change reported in the work that is being done in Bullion, Potosi or Chollar. Hale & Norcross is still raising some good ore. It will nearly pay expenses. The mine is said to be looking well, but more work will have to be done before much of encouragement can be said. The work in Savage, as outlined, indicates more activity before long. The joint Gould & Curry and Best & Belcher east crossdrift is being pushed slowly ahead. In Con. Virginia the work on the 1650-foot level near Best & Belcher and that on the 1000-foot level near Ophir is said to show an improvement. More ore and assaying higher was raised the past week, but it hardly pays running expenses yet. The work in Ophir on the 1000-foot and central tunnel levels attracts some attention, but it is not likely much ore will be found. The work being done in Mexican, Union, Sierra Nevada, Utah and Andes is about the same as heretofore published in this department.

Operations on the Brunswick lode seem to be attracting more attention as work progresses in several of the mines, but it is not at all unreasonable to assert that where the public think ore will be found there will not be a big body, but when it will be developed at another point, if it is ever shown up. In Occidental they are running on the 850-foot level for the downward contiuation of the ore found above. The mill has been closed down. The run does not appear to have been a great success. It is not at all unlikely that the ore will have to be treated differently in the future. The work in Chollar on the 200-foot and 300-foot levels is about the same as heretofore reported. On the 400-foot level the work is growing in interest. It is said to be showing an improvement on the 300-foot level. In Hale & Norcross active work is still the order. That towards or in Savage is quite

THE SANTA ROSA GOLD MINING COMPANY.

encouraging. The work in Gould & Curry is attracting more attention. An ore strike is among the possibilities. In Best & Belcher and Con. Virginia no change is reported in the work.

From the Bodie district nothing of an important character is at hand. Exploiting work is still the order. Ore continues to be raised and milled by Bodie, Standard and Bullion.

From Silver King, Arizona, improving news comes to hand, but it will take time yet for results to be known.

The following illustrates the changes of the week:

ANNUAL MEETING. The Annual Meeting of the stockholders of the Anchor Coal and Development Company will be held at the office of the Company, No. 632 Market St., room 5, San Francisco, California, on TUESDAY, the 20th day of October, 1896, at 1 o'clock P. M., for the purpose of electing a Board of Directors for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, October 17th, at 12 o'clock M.

E. D. FARISH, Secretary.

Office—Room 5, No. 632 Market street, San Francisco, California.

ANNUAL MEETING.—THE REGULAR ANNUAL meeting of the stockholders of the Consolidated California & Virginia Mining Company will be held at the office of the company, room No. 29, Nevada block, San Francisco, California, on MONDAY, the 19th day of October, 1896, at the hour of 1 P. M., for the purpose of electing a board of directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Thursday, October 15, 1896, at 3 o'clock, P. M. A. W. HAVENS, Secretary.

Office Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Larsen & Harris, in the Larsen mine, near Placerville, El Dorado Co., to deposit tailings in North Canyon; from A. F. Sheehan, in the Blue Eyes Mine, in Duncan Canyon, Placer Co., to deposit tailings in a dry ravine; from the Plymouth Consolidated Gold Mining Co., in the Bell & Dorsey Mine, at Indian Diggings, El Dorado Co., to deposit tailings in Indian Diggings Creek and Scott Creek; from E. A. Wiltsee, in the Gold Run Mine, at Gold Run, Placer Co., to deposit tailings in Canyon Creek; and from H. Spaulding to work in the Craycroft Mine, near Downieville, Sierra Co., to deposit tailings in Hughes' Ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on October 12, 1896, at 1:30 P. M.

A Position Wanted

By a Practical Mining and Mill Man, a party having had sixteen years of experience on the Comstock and fifteen years in California gold mining and milling and understands the practical mining and milling in every branch and detail. He is also a first-class accountant. The best of references given. No objection to going into foreign country, as the party speaks English, German, French, Spanish and Dutch.

Address "Practical Miner,"

Care of Mining and Scientific Press, S. F.

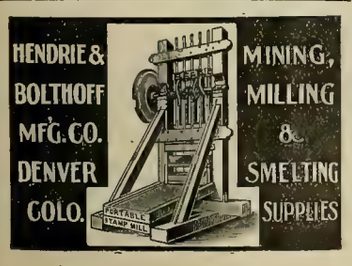
WANTED,

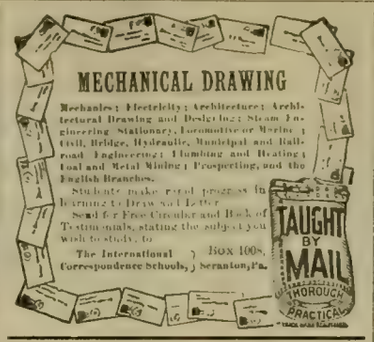
A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office.





MECHANICAL DRAWING
Mechanics; Electricity; Architecture; Architectural Drawing and Designing; Steam Engineering Stationary, Locomotive or Marine; Civil, Bridge, Hydraulic, Municipal and Railroad Engineering; Plumbing and Heating; Coal and Metal Mining; Prospecting, and the English Branches.
Students make rapid progress in learning to Draw and Letter.
Send for Free Circular and Book of Testimonials, stating the subject you wish to study, to
The International Correspondence Schools, BOX 1005, Scranton, Pa.
TAUGHT BY MAIL
THOROUGH PRACTICAL

Assessment Notice.

MARGUERITE GOLD MINING AND MILLING COMPANY. Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first (21) day of September, 1896, an assessment (No. 4) of twenty (20) cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of November, 1896, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, December 15, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. PEACH, Secretary.

Office—237 12th street, San Francisco, Cal. Office hours from 4 to 6 o'clock P. M.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the Thirteenth (13th) day of July, 1896, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
E. C. Cain	170	2,500	50 00
E. C. Cain	171	2,500	50 00
C. L. Dingley, Jr	72	800	16 00
C. L. Dingley, Jr	73	800	16 00
Gen. O. D. Greene	18	10,000	200 00
E. C. Godfrey	169	3,803	76 06
E. C. Godfrey, Trustee	160	6,667	133 34
E. C. Godfrey, Trustee	166	1,333	26 64
E. C. Godfrey, Trustee	167	1,899	36 18
E. C. Godfrey, Trustee	141	1,667	33 34
E. C. Godfrey, Trustee	142	3,000	60 00
W. H. Gregory	153	500	10 00
H. T. Holmes	75	470	9 40
E. H. Hawkins	76	470	9 40
Wm. Jones	77	470	9 40
G. B. Libby	83	2,000	40 00
J. F. R. Landis	138	1,000	20 00
C. A. Moore, Trustee	103	7,222	144 44
C. A. Moore	102	7,222	144 44
Percy P. Moore	117	6,000	120 00
Percy P. Moore	118	7,222	144 44
Percy P. Moore, Trustee	130	468	9 36
Jos. A. Pratt	1	2,500	50 00
Jos. A. Pratt	2	2,500	50 00
Jos. A. Pratt	3	2,500	50 00
Jos. A. Pratt	54	2,500	50 00
John E. Todd	5	2,500	50 00
John E. Todd	6	2,500	50 00
John E. Todd	9	2,500	50 00
John E. Todd	55	2,500	50 00

And in accordance with law, and an order from the Board of Directors, made on the 13th day of July, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 38, Crocker Building, San Francisco, California, on MONDAY, the 21st day of September, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, Room 38, Crocker Building, San Francisco, California.

POSTPONEMENT.

Upon resolution of the Board of Directors of the Gold Bar Consolidated Mining Company, the day of sale for the above delinquent stock was postponed until WEDNESDAY, October 21st, 1896, at the hour of 2 P. M., at the office of the company, Room 38, Crocker Building, San Francisco, California.

E. C. GODFREY, Secretary.

DELINQUENT SALE NOTICE.

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California; location of works, Kelso, Cowlitz county, Washington.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 7) levied on the Twenty-fourth (24th) day of August, 1896, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Mrs. Edith Grey	222	100	3 00
Mrs. Edith Grey	223	100	3 00
R. M. Woodford	559	100	3 00
Jas. E. Ager, Trustee	651	500	15 00
W. H. Gregory	688	500	15 00
W. H. Gregory	689	500	15 00
W. H. Gregory	697	500	15 00
F. M. Meigs	848	350	10 00

And in accordance with law, and an order from the Board of Directors, made on the 24th day of August, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, Room 5, 632 Market St., San Francisco, California, on SATURDAY, the 24th day of October, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. D. FARISH, Secretary.

Office—No. 632 Market Street, Room 5, San Francisco, California.

California Inventors Should consult DEWEY & CO., AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

220 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Losses in Gold Amalgamation.
By W. McDermott and P. W. Duffield.....$2 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hyaraulic Mining.
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

Manual of Hydraulic Mining for the Use of the Practical Miner.
By T. E. Van Wagenan.....$1 00

Manual of Mining.
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.
By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.
By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.
By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Assayer's Guide.
By Oscar M. Lieber.....$1 50

Assayer's Manual.
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

Metallurgy of Silver, Gold and Mercury in the United States.
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

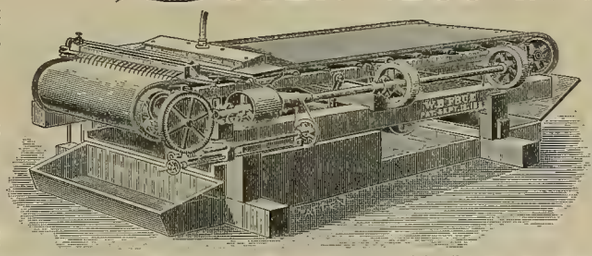
Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.



It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

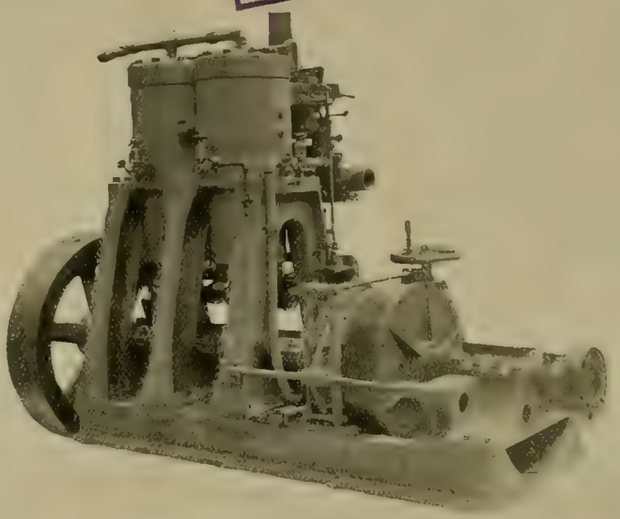
The Gasoline Engines of the Chetco.

The accompanying cut shows one of a pair of gasoline engines installed in the schooner Chetco by the Hercules Gas Engine Works of this city, and marks the beginning of a general use of twin screws driven by gasoline engines in coasting and bay craft. The builders of these engines were surprised at the results obtained from certain improvements applied in this case. The required power was 40 H. P. in each engine; so cylinder capacity, etc., was figured accordingly. In building the engines compression received particular attention; a newly designed and improved sparking device was designed, and a new generator suitable for vaporizing gasoline or distillate oils was tested with satisfactory results. The first engine, as soon as put in motion, was subjected to a power test and developed 53+ H. P. The second engine was not tested until it had several days' run and developed over 60 H. P., all of which gain in power was due to a higher and more efficient compression, a self-regulating and almost perfect generator, and a sparking device which permits of the point of ignition being changed to obtain the greatest efficiency from a given quantity of fuel.



THE CHETCO'S GASOLINE ENGINE.

By the application of an ingenious device these engines are made self-starting, doing away with the unnecessary small starting engine or the bugbear of having to turn the flywheel several times to start. In starting, the point of ignition is changed so that the impulse takes effect with the crank considerably over the center, the point of ignition being advanced after the engine gains speed. In going ahead the engine is directly connected to the propellor shaft. The turning of a small hand wheel starts, stops or reverses the propellor at the will of the operator. The electrodes are heavy and made of hardened steel; the contact points being practically indestructible. All the springs are external and adjustment is possible while the engine is running. Arrangement of parts is such that in case of repairs any part can be removed without disturbing others. These engines weigh slightly over 8500 pounds and occupy a space 3 feet wide, 7 feet long by 6 feet high, each. The engine room in the Chetco is 11 feet wide by 12 feet long, with ample space to get all around the engines.

Besides these two 60 H. P. engines for the Chetco, just installed, the Hercules Engine Works are building a 35 H. P. marine for the Morgan Oyster Co., a 35 H. P. for New Zealand people, and a number of large hoisting and pumping engines for mines in this State.

The excellent results obtained in the Chetco engines will no doubt do much towards increasing the use of gasoline and distillate burning engines in coasting vessels and other small craft.

THE State of Nevada promises to attract more attention from the mining world within a year than it has for many years past. A number of large gold mines have been started up and much development and prospecting work is going on, not in one or two districts, but practically all over the State. The Silver State is taking on the air of having a gold mining boom. The Southern Pacific has made Reno a terminal point and so materially reduced freight rates into that State. The development of agriculture has brought down the price of many supplies required, and, with the reduced cost of milling and mining, it is expected that many abandoned mines will in time be re-opened.

THE Pacific Coast owes its large factories entirely to mining. But for mining the Union Iron Works would never have been able to compete with the East and turn out, as it is doing, the finest kind of war ships in the world. Mining brought giant powder into the world; has been the cause of the invention of the Pelton and other water wheels, far superior to others hitherto used. It has introduced the use of light riveted iron pipes. The discovery of street cable railways was made through the use of a similar cable in the Dardanelles drift mine in Placer county. There will come a time when this will be a great manufacturing State on account of the facilities for obtaining electric power from the streams of the Sierras. There are already many large power transmission plants in contemplation or in course of construction for supplying the mines along the mother lode, and these will be the direct cause of starting up many other new industries.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Cheteo's Gasoline Engine; A New Gold Saving Process, 313. Hot Blast Stove for Silver-Lead Smelting and Copper Matting, 318.

EDITORIAL.—The Gasoline Engines of the Cheteo; Much Attraction Toward the State of Nevada; Much Is Owing to Mining in This State, 313. Visit of Hamilton Smith; The Coming Convention; The Northwest Mining Convention; A Land Office Interference; Locators' Rights; A Mining Lawyer Upon the Supreme Bench, 314.

SCIENTIFIC PROGRESS.—Emmens' Alchemy; An Interesting Source of Lighting; A New Source of Vanadium Compound; Circulation of the Papers of the World; Information Upon Scientific Questions; Technical Society Work; Spontaneous Combustion of Coal on Ship Board, 317.

MECHANICAL PROGRESS.—A Hot Blast System for Copper Matting and Silver-Lead Furnaces. 318.

ELECTRICAL PROGRESS.—Electric Railway Motors; Roentgen Rays, 318. "The Present Status of Power Transmission;" An Agreement Made; An Electric Plant for Electrocution; Photographing Objects by Roentgen's Method, 319.

PRACTICAL INFORMATION.—The Future of the Sahara; Torpedo Boats; Life-Saving Stations; Canals a Success, 319.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories. 322-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 330.

MISCELLANEOUS.—Concentrates, 315. A New Gold Saving Process; Extent of Canadian Gold Fields; The Cyanide Process in the United States, 316. Street-Car Lines in New York, 319. Notices of Recent Patents; Obituary; Recent Patents; Coast Industrial Notes; Recently Declared Mining Dividends; Personal; Recent California Mining Incorporations, 320. Books Received, 323.

The Coming Mining Covention.

There were represented at the last convention of the California Miners' Association, thirteen counties. This year sixteen counties will send delegations. The growth of the mining industry all over the State has stimulated interest in the Miners' Association. When it was first organized there was much work to do and little money to do it with. More than that, the industry altogether was in such a bad way that they were compelled to work against heavy odds. The Association has done good work. It has accomplished a fair proportion of what it set out to do, but as the industry increases the duties of such an organization are increasing. There will be much more opportunity for its good offices in the future even than there has been in the past.

So far the Association has had considerable difficulty in collecting the necessary funds, and its officers and even attorneys have contributed their services free of charge. It seems to us that the time has come when the Association should have a permanent home or headquarters in this city, with a paid Secretary as suggested by Mr. Sonntag. With such an office and an officer to care for the details much more satisfactory work can be done by those disinterested individuals who have so freely in the past given their services to the Association.

Among the questions that will probably come before the convention will be the appointment of a legislative committee to represent the interests of the miners next winter in Sacramento. The legislative committee appointed last year had much business to attend to in connection with the mineral land bill and other matters in Congress, and did good work. Much more will be expected of a similar committee at the next session of Congress. At the last session of the State Legislature there was not so much of moment before that body as there probably will be at its next session.

The State Mineralogist has recommended a radical change in the work of the Mining Bureau in the separation of the mining work and geological survey work. He has also suggested that some provision be made for inspection of mines. It is likely that these suggestions will be recommended to the Legislature by the Governor. It is important that the Miners' Association be well represented at Sacramento to see that satisfactory laws be enacted, and that sufficient funds be appropriated for carrying on the work of the bureau. No industry has ever asked less than that of mining from the State, and none has received less.

We have already suggested the advantage of having a representative of mining in the Board of Regents of the State University. Governor Budd will during his term of office appoint at least two regents, and he certainly would give heed to recommendations from such a representative and influential body as the Miners' Association in this matter. There are enrolled in the College of Mines of the State University more students than in any other technical college in that institution, and yet less money is spent upon it than upon any other. California has at Berkeley one of the great universities of the country, and there is every reason why it should have there the best mining school in the world.

A Land Office Interference.

The necessity for curtailing the power of the land department in the disposal of the public lands was made glaringly apparent by the efforts of the Miners' Association to prevent the legal absorption of the mineral lands lying within the limits of the several railroad grants in this State. The question was more than a local one and has engaged the attention of sister organizations in the mining States, and finally became a national issue by the adoption of a drastic plank in the platform of one of the recent national conventions.

Another necessity for curtailing the power of the land department of the United States is evidenced by its recent treatment of an act of Congress passed at its last session, which was designed to foster the interests of the miners, as well as of the public at large, by permitting the use of a right of way to the extent of 25 feet, together with the use of necessary ground, not exceeding forty acres, upon the public land and forest reservations of the United States, by any citizen of the United States, for the purpose of generating, manufacturing or distributing electric power, under general regulations, to be fixed by the Secretary of the Interior.

The advantages in utilizing this permission in producing electricity by water power is apparent, but the Secretary of the Interior, under the power granted to him, has promulgated such regulations as practically to deprive the act of any real value.

Mr. A. H. Ricketts of this city has called our attention to these instructions, which were drawn up by Edward A. Bowers, Acting Commissioner of the Land Office, and approved by Hoke Smith, Secretary of the Interior. Section No. 5 of these regulations is as follows: "If the application is satisfactory to the Department, the Secretary of the Interior will give the required permission in such form as may be deemed proper, according to the features of each case. And it is to be expressly understood in every case that the permission extends only to the public lands in the United States not within the limits of any park, forest, military or Indian reservation; that it is at any time subject to modification or revocation; that the disposal by the United States of any tract crossed by the permitted right of way is of itself, without further act on the part of the Department, a revocation of the permission, so far as it affects the tract; and that such permission is subject to any future regulations of the Department."

As we have stated, this article of the regulations of the land office practically annuls the law passed by Congress. It leaves the people who might have been benefited in exactly the same position as if no such law had been passed. For should any one attempt to take advantage of its provisions and obtain permission of right of way over government land any one else might come in and locate the ground over which his right of way runs and it would be immediately revoked under the Secretary's rulings.

This is a matter of special importance to the mining industry in California in view of the large number of enterprises lately undertaken for supplying electric power to the mines. We would suggest that the Miners' Association take up the question at its convention next month.

It is possible that if some company or companies interested would bring a test case before the Federal courts the trouble may be remedied by a judicial declaration of the invalidity of the Secretary's regulations.

It is reported on reliable authority that one of the chief causes for Hamilton Smith's coming visit to California is to have an examination made of the Mariposa grant. In another column last week and this, we gave some account of the proposed deal, which will mean, if carried out, the purchase of the property by the Exploration Company, who will place it on the London market.

The Northwest Mining Convention.

At the annual meeting of the Northwest Mining Association the president, G. B. Dennis, delivered an able address. Speaking of the progress of mining, he said:

What we call the science of mining came down to us from hoary antiquity, and has has grown like all others of the human arts, from the rudest beginnings in the rude twilight of the infancy of our race, ages and ages before the sun of history rose above the horizon of recorded time. Onward, onward and ever onward marches the industry of mining. One by one we have cut away the rude appliances and methods of the past; one by one we have seized the new weapons of modern practice and organized them into a harmonious whole, till the miner who began in ages past by fashioning a hammer of a river pebble, and wearing a chisel out of a wayside stone, and clipping the glittering specks from some chance outcrop, has become a broad-minded scientist, versed in minerals and the world's structure, a possessor of the secrets of chemistry, a wielder of mechanical power, a harnesser of lightning.

Speaking of the proposed establishment of a Secretaryship of Mining in the Federal Government, he said:

The office of minister of mines for the British provinces has proven a great boon to mining there, and it is with the same intent that we endeavor to establish the same thing for these United States. Our great mining interests are fast awakening to its importance, and demand that it receive at the hands of the United States Government that recognition which shall place it upon a parity with other commercial industries. We hope to be successful.

Locators' Rights.

In the very recent case of Black vs. Elkhorn Mining Company (163 U. S. 445), the United States Supreme Court says:

The interest in a mining claim, prior to the payment of any money for the granting of a patent for the land is nothing more than a right to the exclusive possession of the land based upon conditions subsequent, a failure to fulfill which forfeits the locators' interest in the claim. To sum up as to the character of the right which is granted by the United States to a locator, we find: (1) That no written instrument is necessary to create it. Locating upon the land and continuing yearly to do the work provided for by the statute gives to and continues in the locator the right of possession as stated in the statute. (2) This right, conditional in its character, may be forfeited by the failure of the locator to do the necessary amount of work; or if, being one among several locators, he neglects to pay his share for the work which has been done by his co-owners, his right and interest in the claim may be forfeited to such co-owners under the provisions of the statute. (3) His interest in the claim may also be forfeited by his abandonment, with an intention to renounce his right of possession. It cannot be doubted that an actual abandonment of possession by a locator of a mining claim, such as would work an abandonment of any other easement, would terminate all the right of possession which the locator then had.

It is time that there should be a mining lawyer of recognized standing upon the Supreme Bench of the State of California to avoid conflicting—and at times, almost absurd—decisions now coming from the Bench, which show a lamentable weakness in that body in the knowledge of mining laws. The appointment of Judge Field to the Supreme Bench of the United States, after he had acquired in California a splendid knowledge of mining law, has enriched the reports of that court with opinions which will always remain standard. But for his presence upon the Bench there would now be much more confusion in mining law than there is in the West, and, as it is, it is bad enough. Mining laws have grown largely out of and are based upon local mining customs, just as much of our law is based upon the common law which grew out of old English customs. Naturally more ability and knowledge of the subject is required to interpret the laws regarding mining than any other industry, for the reason that they are based not upon old laws or customs, but upon the rules adopted by the miners in comparatively recent years. The Supreme Court itself has in its hands the appointment of the Court Commissioners and in that has the means of remedying what is getting to be an evil. It might be well for the Miners' Association to take up this matter and ask its members to use their influence with future political conventions to secure the nomination of at least one mining lawyer for Justice of the Supreme Bench.

Concentrates.

THE Louisiana Mining Company in Mariposa county propose to erect a 10-stamp mill.

VICTOR, the leading town of the Cripple Creek district, claims a population of 8000.

THE mill at the Metropolitan mine, at Moore's Flat, Nevada county, has been started up.

THE Las Amarillas mines in Sonora, Mexico, are producing from $110,000 to $120,000 gold monthly.

THE owners of the Lighthouse mine in Amador county propose to erect a 5 or 10-stamp mill shortly.

M. PABLO LE ROYAL, the French mining engineer, recently purchased large coal properties in Puebla, Mexico.

THE Frazier Mining Company proposes to put in a 5 or 10-stamp mill on their property at Granite Basin, Plumas county.

THE first roasting furnace for the reduction of ores ever built on the Comstock is nearly ready for use at the Kinkead mill.

PREPARATIONS are being made to put extensive machinery in the Sand Hill drift gravel mine near Camanche, Calaveras county.

IT is announced that R. U. Goode, of the U. S. Geological Survey, will soon go to Eureka, Nevada, to make a survey of that district.

THE Montana mine, in Willow Valley district, Nevada county, has been bonded for two years to Francis N. Burns and C. H. Tubbs.

IN Corea, where several Colorado mining men have lately gone, there are said to be nearly 3000 mines worked by the crudest methods, and mostly placers.

SAMUEL NEWHOUSE, who has made some investments for his London syndicate in this State, has purchased the Henry M. group of ten claims near Bingham, Utah.

AT no period since the discovery of gold has such large sums of money been expended as during the past two years on the divide above Forest Hill, says the Colfax *Sentinel*.

ACCORDING to *Modern Mexico*, the old Zubiate mine, nine miles east of Minas Prietas, has been worked for over 100 years, and in that time has produced over $15,000,000.

SIXTY-FIVE sacks of $65,000 ore were stolen from the May Belle mine, Victor, Col., lately. The company has no clue, but it sought revenge by discharging every man about the works.

THE Gold Exploration and Development Company of British Columbia have bonded the Flossie L. and Little Darling mineral claims, near the Jumbo, in the Rossland district, for $100,000 each.

THE Calaveras *Chronicle*, published at Mokelumne Hill, is the oldest weekly paper on the coast, having made its first appearance on October 10, 1851. The Shasta *Courier* comes next on the list.

THE War Eagle and Iron Mask, two of the leading mines of the Trail Creek district, have been sold to London capitalists. The prices are not given out. The War Eagle has paid $197,000 in dividends.

THE first locomotive engine ever built and run successfully was in a mine in England. Mining has been the direct cause of more inventions and improvements in machinery than any other single industry.

ACCORDING to the Trinity *Journal*, a silver ledge has been discovered in Stuart's Fork in that county, in which the ore is claimed to be of high grade. This is the first silver mine discovered in Trinity.

IT is reported that the United States Exploration Company of London have about decided to close the deal for the purchase of the Amador Queen mine in Amador county. The price is said to be $150,000.

THE U. S. Government is establishing a military telegraph system in southern Arizona in the part most exposed to the attacks of renegade Apaches and where there is a number of exposed mining camps.

IN addition to the precious metals, Colorado mines produced in 1895, 94,222,258 pounds of lead, worth $2,955,000; 8,245,494 pounds of copper, worth $877,492; coal to the value of $5,800,000 and iron to the value of $3,150,000.

THE Rockefellers and other Standard Oil people have been making examinations of properties in different districts in Utah for some time past, and are reported to have made some purchases in Mammoth and Clifton.

AN English company has secured a bond on the St. Peter-Martin properties at Jerome, Arizona, at $100,000, and it is reported that W. A. Clark, president of the United Verde mines has purchased the Cliff copper mine.

A FORCE of men have been taking ore out from under the Hotel Victor, in Cripple Creek, where the vein crops out. It is said to run all the way from $250 to $600 per ton. The vein was exposed where the street was graded.

IT is reported that the new owners of the Chino ranch in San Bernardino county will soon build a wagon-road that will tap a large bed of asphalt. Near the asphalt deposits, it is claimed, are oil fields, and arrangements are being made to sink.

THERE has been a large increase in mining news from the State of Nevada of late, particularly as to the investment of outside capital in opening up mines which have long been idle and in putting in new mills and plants for working ores by improved methods.

THE number of stamps in the mills of the Rand in South Africa on July 30, 1896, was 3095. The mines at present milling are expected to increase this number to 3700 by June 30, 1897. Besides this, many new companies are expected to bring up the total number to nearly 5000.

As to the probable output of Cripple Creek for 1896 the Colorado Springs *Mining Investor* says that conservative estimates place it at $10,000,000. During the first eight months of the year the total was not over $5,500,000, but it is claimed that the monthly output is now over $1,000,000.

THEY have a man with a divining rod in the Black Hills who is persuading many of his ability to locate ore bodies. What has become of our old divining rod man? These should be good times for him. There are enough credulous people even among the miners who would give him a good living.

THE United States Debris Commission has begun work on the Yuba river, between Marysville and Deguerre Point, to keep the river in its old channel by the construction of jetties, or wing dams, along the course of the river. A brush dam of considerable proportions will be built at the head of the channel.

IF the proposed scheme to build a large chlorination and lixiviation works on the bluff northeast of the university is carried out, it will be the greatest enterprise in the mining history of Boulder county, says the Boulder, Colorado, *News*. It is said the buildings will cost $150,000 and be capable of treating 100 tons per day.

IT is learned, although Mr. Wilson is reticent on the subject, that he has a mine worth millions located within a few miles of Prescott, and that he has just refused an offer of $10,000 for it.—Albuquerque Citizen. There is nothing very remarkable about a man refusing a $10,000 offer for a mine worth millions.—Arizona Journal-Miner.

DURING the past eight years, and principally in the last four years, fifty-two companies in the Rocky mountain district alone have installed electric power machinery for mining and ore reducing purposes, compaising 62 generators, aggregating 7988 kilowatts, and 135 motors, aggregating 4816 H. P., operating every variety of mining and milling machinery.

W. A. CLARK about a month ago bought an interest in the Mayflower mine in the Tobacco Root range, Montana, and within two weeks took out $100,000. The ore of the district is of a peculiar flinty character in quartzite, limestone and dolomite. In rock which assays from $400 to $600 a ton in gold, not a speck of gold can be seen with a magnifying glass, and crushing and panning will not yield a single color.

A NEW development company has just been formed in this city to utilize the invention of Prof. Kimball, who, by his magneto-electric batteries combined with his psycometric talent, claims that he can read the mineral formation and locate the metalliferous veins and the rich ore bodies therein as easily as a surgeon can now by means of the X ray locate a metallic substance in the human body.

THE biggest timbers ever seen in Montana are being received at the mines of the Anaconda company in Butte, says the Anaconda *Record*. They measure 2 feet square and in length extend all the way from one to three flat cars. These timbers come from Tacoma and are used as gallows frames for the new hoisting plants that have been going up at the company's mines during the last six months.

WE have repeatedly called attention to the extensive deposits of sulphur near the Colorado river in Lower California, and that capital should not jump at such an opportunity is difficult to understand, especially when the recent sharp advance in the price of sulphur is considered, says the *Lower Californian*. The opening of these mines would very materially affect the operations of the Anglo-Sicilian Sulphur Trust.

THE latest reports from Leadville are to the effect that a proposition from the Miners' Union to declare off the strike, providing the men were reinstated, was submitted through the Governor of Colorado to the mine managers and was unqualifiedly declined. Nine of the managers claim that the only condition on which the miners can go to work is to declare off the strike and depend on their own good behavior to get back.

IT is reported that the Venezuelan question will soon be settled. If it so turns out that the English obtain a good slice of the disputed territory there will doubtless soon be considerable mining activity in that country. Before President Cleveland issued his manifesto several English syndicates had obtained concessions and prepared to send in exploring parties to look for mines, but gave that up pending settlement of the dispute.

THE Homestake mine in the Black Hills, South Dakota, is receiving a good deal of attention of late through the report of its sale to the Exploration Company of London. As yet no definite announcement of a sale has been made by authorized parties. However, the property has been examined by experts for the London syndicate, and it is probable that other examinations will be made before a decision is arrived at. The Homestake has paid in dividends a trifle less than $6,000,000.

ACCORDING to a report of the State Government of Sinaloa, Mexico, there are in operation six concerns of the first order, which reduce 144,000 tons, at an average of $30 a ton, making an annual product of over $4,300,000; ten concerns of the second order, which reduce 48,000 tons, at $50—a total annual product of $2,400,000. There are besides a number of other concerns of which figures are not given. It is estimated that 5000 men are employed, and the mineral output already exceeds $8,000,000, and is rapidly increasing.

AT the Old Faithful mine in Montana the men, fearing that they would not be paid their wages, took possession of the property and locked up the superintendent as hostage. Finally, after the sheriff had locked up most of the men, terms were made by which they were to receive all the gold taken out until paid. It is only a little over a month since the Associated Press reported the discovery of ore, and plenty of it, too, worth $150,000 a ton—"not picked ore, either." There must be a great deal of money owing the miners for wages.

IN the Dominion Parliament on the 16th of September Mr. Bostock moved "that in the opinion of this House it will be in the interest of immigration and the development of the Dominion that the Government should collect, through the Department of Agriculture, all the information possible with respect to the mining interests of British Columbia and the other provinces of the Dominion, and distribute it." Our Government might take a lesson from Canada. The hearty support given to the mining interests of British Columbia by the Dominion Government has done much for the rapid development of the mines.

THE news of the probable suspension of work at the famous Drum Lummon mine near Marysville has been received with genuine regret in Butte, says the *Inter-Mountain*. The Drum Lummon mine was discovered by Thomas Cruse of Helena late in the 70s, and the controlling influence was sold some time later to an English syndicate. Mr. Cruse retained a small interest until a few years ago, when he disposed of all his stock. The Montana company was capitalized for $3,300,000 and paid in dividends to October, 1895, the sum of $2,890,637. It is understood that a number of miners will be retained in opening up some adjoining properties.

THE Northwest Mining Association held its annual meeting at Spokane, Washington, last week. Among the important questions brought before the convention were the establishment of a department of mining in the Federal Government, the mineral lands upon railroad grants, the erection of a permanent building for the association, and the building of a home for disabled members. The great increase in the mining industry in the northwest during the past year was the cause of making the meeting a very successful one. G. B. Dennis was re-elected president of the association; General A. P. Curry, vice-president; L. K. Armstrong, secretary, and J. C. Warefield were all re-elected.

THE fact that the British Association for the Advancement of Science will hold its summer meeting for 1897 in Toronto has called out from Canada a proposal that a joint meeting, or meetings, shall be held in the Dominion in which the American Institute of Mining Engineers, the British Iron and Steel Institute and the different associations of mining engineers in Canada and the Federated Institution of Mining Engineers of Great Britain are asked to join, says the Rossland *Mining Review*. In case the proposition is accepted arrangements will be made for a number of trips and excursions which will enable the visitors from abroad to study for themselves the mineral resources of the Dominion.

THE United States Geological Survey, in pursuance of its policy of making examinations of new mining districts, some six months ago sent to the Yukon in Alaska to examine the gold fields there J. E. Spurr, H. C. Schrader and H. B. Goodrich, who returned last week. In speaking of the country, one of them is reported as saying: "We examined all the gold bearing gulches of the Yukon river down to St. Michaels on the coast. Only placer mining has thus far been attempted in that region, and a good deal of gold is being taken out. The product is sure to increase year by year for some time. I do not know of any larger placer mining district in the country than that. A mineral belt similar to the so-called mother lode of California runs across that whole country in a northwest direction, and along it there are deposits in distinct and different formations."

A CORRESPONDENT of the Oroville *Register* writes: "The parties engaged in business in this town do not seem to realize the importance of sustaining the Miners' Association. There is not a man in this town who is not benefited by the mining interests, no matter what his business or occupation. Therefore, anything that promotes the mining interests helps him. Now, just think for a moment: if the mining association is allowed to dissolve, will it tend to benefit or injure this town? When capital comes to this coast looking for mining investment, if any inquiry is made about Butte county, they will be told that the county did not even have ambition enough to sustain its miners' county association, and they, the capitalists, will draw their own inference from that fact, which will not tend to the benefit of Butte county."

THE Sierra County Miners Association at its annual convention last week decided to ally itself with the State Association, and chose the following delegates to the State Convention: J. M. Harper, C. P. Gale, Paul Meroux, H. W. Orear, J. W. Orear, H. H. Squire, John Scott, S. F. Purdy, F. R. Webe, Ed. F. Webe, T. L. Ford, L. F. Byington, W. H. Byington, Louis Rosenfeld, M. W. Mather, J. O. Jones, E. A. Meily, F. W. Page, Jas. McGregor, F. H. Campbell, F. W. Hanley, A. B. Moulder, Julian Sonntag, C. T. Hamilton, Andrew Carrigan, P. Van Clief, I. Copeland, A. J. Meroux, Stanley A. Smith, J. A. Vaughn, J. F. Rowdery, Dan T. Cole, M. H. Mead, Henry Kingdon, A. Westall, H. Spaulding Sr., W. F. Eschbacher, John Costa, W. J. Holmes, T. H. Crossman, S. Wiggins, P. R. Gardner, J. M. Haven, I. T. Mooney, Geo. D. Gray, Giles H. Gray, Thos. E. Haven, J. H. Hickox, W. S. George, Thos. Kirkpatrick, G. W. Hughes, C. C. McIvor.

LABORERS in South Africa bear relations to their employers that are somewhat different from those in this country. The South African *Mining Journal*, speaking of a meeting of the mine managers at which the maximum wages was fixed, says: "Resolutions were unanimously passed approving of the scheme of classification of the maximum wages; approving of a uniform method of governing compounds, and providing that each native shall put in nine hours' actual work per day in the mine. This latter resolution does away with the system that has hitherto been practiced, under which a boy has, as a rule, been allowed to leave off work on having performed a certain duty, such as drilling a hole of certain depth, and is a very great step in the right direction. Under the old system the boy who was active, capable and hard working had no rise in wages to expect as a reward of his capability: he could merely get through his stated task more quickly than his neighbors, and so have more time on the surface for loafing or drinking. Indeed, a good many compound managers have believed that the drinking boys in the compound were in many instances the best workers. The old system, now to be abolished, explained this state of things; the best workers had the most idle time on their hands. Under the new system, if properly worked, the best workers will work as long as their less competent neighbors, but the scheme of a maximum scale of wages should adjust this matter in such a way as to compensate good workers by increased pay, instead of by allowing them an extra spell of idleness, a step which is clearly a good one. In the matter of the pass regulations compound managers are already complaining that, owing to the inertness of some of those who ought to be most alive to the importance of maintaining the regulations strictly, they are not producing the effect which was hoped of them, and that in fact the new pass law is failing in its main object—that of preventing natives from running away. Now, it was definitely arranged, at the above meeting of mine managers, that the boys on each mine should be given notice through their compound manager, at 6:30 A. M. on the first day of September, that the reduction of native wages will come into force on the first of October; and, by order of the council, this resolution was advertised in the local papers, and every manager was requested to obtain the necessary authority from his company to enable him to carry the resolution into effect. All along the reef, therefore, at the stated time, the announcement was made simultaneously, as directed. It was expected that there might be mutinies among the boys, and troubles were vaguely expected. Everything, however, as a matter of fact, passed off well. On a few properties the boys perhaps wavered for a few hours, and drank rather more than usual, but no disturbance or outbreak occurred."

A New Gold Saving Process.

Written for the MINING AND SCIENTIFIC PRESS by DR. P. LANGHAMMER.

Scientists, especially practical miners and metallurgists, agree that gold is one of the most widely distributed elements known, for not only does it exist in the earth, but is also found in the water and in the very air that we breathe, in greater or less quantities. It exists, however, in such a minute state of division, or, rather, in such an impalpable form, that all attempts to extract it by mechanical means have been failures; but chemical processes have at last been discovered that enable one to successfully cope with the problem, and, where gold exists in anything like paying quantities, its successful extraction is now secured.

In 1863 I discovered that immense quantities of this fine, impalpable gold were to be found at the foot of the Vaal mountains in southeastern Africa, where the Crocodile river enters into the flats near the Marquez or Delagoa bay, and in 1877 I found the same thing in South America, the republic of Colombia, State of Panama, along the Rio Chagres, Rio Obispo, Rio Magdalena, etc., on the Pacific slope, a few miles below the old city of Panama, in many places in Mexico, and, lately in 1895, on the Pacific coast of the Olympia peninsula, in the State of Washington.

At any of these localities one may take a miner's gold pan and fill it half full of sand, without having any idea that it may contain minute free gold, and, on adding water, stirring carefully and then setting the pan in the sun, a thin film of free gold will be found floating on the surface, the reflection of which will leave no doubt as to its character; siphoning the water off and sun-drying the residue, it will be found that it is covered by a thin film of metallic gold, which is clearly visible under the microscope. This gold can be saved in its larger part by chemicals, but not by mechanical means. It is safe to say that in all stamp-mill operations, where water comes in contact with the auriferous material, this minute gold will be inevitably lost—no mechanical appliances can save it.

I have made a careful study of this problem for the last thirty years and am convinced that only by chemical means is any solution possible. Potassic cyanide, I have found, is the surest and best solvent, and as early as 1877 I used it with great success in South America. I was then operating on auriferous "raw" iron pyrites, which carried $19 in gold per ton, and succeeded in saving 72 per cent of the gold. After applying strongly-heated air to the pulverized material, I found that the loss only amounted to 8, instead of 28, per cent. After years of experimenting and of careful observation, I have found that in auriferous sand, where the gold is carried in very minute particles, these particles of gold will be found in films enveloping nearly every particle of the material. By heating this material under constant agitation, these films of gold can be detached and made readily available for treatment by chemical solution. The same is true of auriferous ore where the noble metal exists in a state of fine division.

I have applied for and been granted a patent which involves this principle, and the main point in this process is that the gold does not and must not come into contact with water until it reaches the chemical solution, and this chemical solution should be used over and over again. Therefore, we have to deal with two separate and distinct processes: First, the treatment of auriferous sand, and, second, the treatment of auriferous and argentiferous ores. In the first case nature has done much of the mechanical work and the material comes to hand already crushed. In other words, we have sand and gravel, and, in consequence, no expensive milling machinery is required.

The material is dumped into a hopper provided with a grizzly, so that any large gravel may at once be separated and carried away. The finer material is then conveyed by an automatic feeder to a large unperforated drying screen, supplied with the necessary drying hot air pipes which are in connection with a suitable heating apparatus. The material is then passed through sizing screens in which it is further dried, if necessary. These screens are provided with rigid interior spirals with projecting teeth, with a view to keeping the material in constant agitation and friction, the object being to loosen and detach any minute particles of gold from the particles of sand.

From the screens the material passes into ore bins which are kept perfectly dry and "dust tight." The various sizes of such rich auriferous sand are separately treated with cyanide solution in percolation tanks. Any material too coarse to pass through the last screen is passed on through to the dump, unless it is found that such material carries coarse gold, in which case it is directly concentrated and the gold smelted. After the material has been thoroughly treated in the percolation tanks the solution is then passed through electric precipitation boxes. Plates of sheet iron are used as anodes and plates of lead as cathodes. The gold contained in the material is deposited in metallic form in a thin film on lead plates, which film becomes thicker the longer the process is continued. Zinc precipitation boxes may be used, but the electric process is considered by me to be more certain and in the long run to give the best results.

It will be noted that with this process very little water is used, as the solution is used over and over again, thus insuring against loss; for, after passing through the precipitation boxes the solution is run off into sump tanks and is then pumped back into the storage tanks to be used again.

With any auriferous and argentiferous ores the process is much the same, except that a grizzly, crushers and pulverizers must be used. The main point to be observed is that the pulverized ore must be carefully sized. Slime should be avoided in ordinary treatments. So far, copper and lead carbonates are the only ores that cannot be successfully treated.

The works erected for the Wyandotte M. M. & G. Co. of Chicago (see illustration page 313) are situated in the northern part of Okanogan county, State of Washington, nearly opposite Mount Chapaca and four miles from the British Columbia boundary line. Their capacity is sixty tons daily, which can be easily increased to one hundred tons, and the ores to be treated are of various kinds; therefore, a somewhat more complicated arrangement of machinery than outlined above was necessary.

The company owns seven claims, of which three have been developed and will be operated to furnish ore to the works.

The Oro Fino has a vein 4 feet thick of dark quartz containing iron pyrites only, with a strong dissemination of graphite in layers. It averages about $8 in gold per ton, and preliminary experiments made on a very large scale showed that the process will save 92½ per cent of the gold. The ore from the Vulture and Wyandotte mines consists of a white quartz disseminated with fine galena, iron and copper pyrites and some zinc. It runs an average of $14 in gold per ton and 89 ounces of silver. With this process 87½ per cent of the gold and 60 per cent of the silver are saved, and the bulk of the remainder is saved by subsequent concentration. It is worthy of note that in these ores it is almost impossible to detect the smallest particle of free gold, but it is there in a state of very minute division or in combination with sulphur. Should further development show a coarser grade of gold the fine gold will be saved first and and the coarser particles subsequently, as well as the base metals, which will be concentrated and then smelted into lead bullion or copper matte.

The machinery used consists of a 60 H. P. boiler and a Fisher automatic high-speed engine; a Morris No. 4 crusher and a Ball pulverizer, all run by a suitable system of shafting. A 125-light dynamo supplies light to the works, mines and dwellings, and a 1½ kilowatt, six-volt dynamo supplies the current for the electric precipitation boxes.

There are eight tanks, 20 feet in diameter and 5 feet deep, and two sump tanks, 20 feet in diameter and 8 feet deep. Two of these tanks are used for storage purposes and contain respectively strong and weak solutions.

The ore, being directly delivered from the mines, passes over a grizzly and the finer material is sent direct to the pulverizer, the coarser ore going to the crusher and is there pulverized. The fine stuff is then sized through screens and passes into ore bins which are perfectly dust-tight. From these bins the material goes to the percolation vats, where the solution percolates through the mass upwards from a system of perforated pipes in the bottom of each tank. Strong solution is first used, and after this has been drawn off a weaker wash solution is then introduced. Both of these solutions are then passed through the electric precipitation boxes, and then go to the sump tanks, pumped up into the storage tanks to be used over again after being brought to the proper strength.

By this method very little water is required, only enough to make up the loss by evaporation and soaking into the ore.

In conclusion, I wish to emphasize one point, and that is that by this process every effort is made to save the fine gold first, for there is no difficulty whatever saving the coarser particles afterwards.

Extent of Canadian Gold Fields.

The Canadian *Mining Review* for September says: "British Columbia is not the only gold producing province in the Dominion, as one might suppose. There have been years when steady-going Nova Scotian stamp mills have surpassed it in output. Quebec, too, has gold mines of promise—placers, like most of the producing mines of the West; but, perhaps of all the provinces, Ontario has the widest diffusion of gold, for it has been found here and there from Madoc to the Manitoba boundary, a distance of more than 900 miles in a straight line, and in its western portion the locations where gold has been proved to exist number hundreds."

The Cyanide Process in the United States.*

By GEORGE A. PACKARD, Boston, Mass.

(*Condensed.*)

The process has been applied on a large scale only to rather low grade, highly siliceous ores, containing but a small percentage of base metals and having their value principally in gold. In fact, the cyanide process has a field of its own. I have been told of one instance in which cyanide competed successfully with the smelters on ore carrying as high as 4 ounces in gold, the ore being one in which the value was easily extracted to a high percentage. In the Cripple Creek district, where an extraction of 90 per cent is obtained in from four to six days, and where the smelting charges were from $5 to $7 per ton, ore running as high as $40 was in 1895 bought by the cyanide mills.

With silver ores, while some very good results have been obtained, the length of time required for treatment has usually been too long, and the consumption of cyanide too high, for the process to give economical results. There are, however, several plants in the vicinity of Tombstone, Arizona, working on silver ores. In the case of ores containing from 1 to 10 ounces of silver, in addition to a commercial gold value, the process has been advantageously employed. Thus the Golden Reward Company, in South Dakota, having certain ores containing from 1 to 5 ounces of silver which was lost in chlorination, has built an addition to the plant, in which such ores are treated with cyanide.

Chlorination is the only process the field of which the cyanide method is seriously invading. For mines located at a considerable distance from a railroad the cost of transportation of the chemicals used in chlorination has been hitherto an almost prohibitory factor; and here, at least until the use of liquid chlorine becomes a practical success, cyanide has the advantage. At the Golden Reward plant, early in 1895, they were using for chlorination about 35 pounds of chemicals per ton of ore, while only 2½ pounds were necessary for treating 1 ton with cyanide. As already observed, if there is silver present, the cyanide has the advantage that part of the silver is recovered; but, so far as my observation goes, the gold extraction is usually higher by chlorination than by cyanide.

With amalgamation, cyanide enters into competition only in the case of very finely divided gold, which is saved more or less successfully in pans. Generally speaking, ores suited to one process are not suited to the other. Thus at the mill at Cooke, Montana, there was a sudden change last year in the character of the ore. A quantity of very fine free gold appeared in a mine where a "color" had but rarely been seen before. This gold, although so fine as to pass through a 60-mesh screen, could not be extracted by the strength of the solution employed and in the length of time usually allowed on the ore there being treated, while the value of this new ore was too low to permit the use of a stronger solution (entailing larger cyanide consumption) or a longer time. To save this gold, and a little pyrites, the tails were passed over a system of riffles and blankets. A similar arrangement has since been used at one of the Florence, Colorado, mills to save the coarse gold resulting from roasting ores containing tellurides.

The treatment of low-grade concentrates has not generally proved a success, on account of the long time and high consumption of cyanide involved, and smelter rates are too favorable to make the process profitable on high-grade concentrates, save in exceptional cases.

There are at least two districts in this country where the cyanide process has proved a panacea—Camp Floyd (Mercur), Utah, and Gilt Edge, Mont. To these, Cripple Creek might be added, for the ability to sell low-grade ores has certainly aided largely in the development of that camp.

At Mercur, Mr. E. A. Schneider says "the gold occurs as a fine coating on particles of magnetic iron in limestone." The ore is somewhat porous, and the value occurs largely along certain lines of cleavage which become the lines of fracture, enabling the ore to be treated with only a very coarse crushing. In nearly all of the mines in this district cinnabar and more or less arsenic occurs. Much of it, however, is deposited on the hanging wall in such a manner that very little is sent to the mills. At the Marion mill, I was told that they sometimes retorted the "slimes" on cleaning up in order to save the quicksilver deposited on the zinc. At the Geyser mill I was told that they sometimes found arsenic as the oxide, though never enough to amount to more than ½ per cent. All of the arsenic which I saw in the district was a sulphide. It has been found that the presence of a very small quantity of arsenic in the ores soon fouls the solutions so that they cannot be titrated for standardizing; and at most of the mills the solu-

*Trans Am. Inst. M. E., September, 1896.

tion is thrown away if it becomes badly fouled.

The Gilt Edge ore contains porphyry and limestone, and is not unlike the ores of the Camp Floyd district. There are but two mills in operation here.

The ores of the Cripple Creek district are a porphyry (or phonolite), containing a fraction of 1 per cent of tellurium, some of which, as Prof. Anderson of the American Reduction Co. informs me, is combined with gold and some with iron. When the tellurium occurs in the oxidized condition, the ores are easily treated raw; but in the case of other ores a preliminary roast is required.

In South Dakota, the ores all contain a little sulphur, and in some the sulphur runs as high as 5 per cent. Both mills have found that a higher extraction is obtainable after roasting, but it is accompanied by a higher consumption of cyanide.

In general, ores containing much sulphur have given unsatisfactory results. I obtained some very good extractions in tests of small quantities of pyritic ores at Cooke, Mont., using cyanogen bromide, and Mr. H. C. Cutter obtained similar results at the University of Minnesota. Mr. Wallace Macgregor, in charge of the Congress, Ariz., cyanide mill, reports a 93 per cent extraction from ore containing pyrites, which had received but a slight roast, and which he treated with potassium cyanide alone. Mr. Macgregor, in some recent experiments on ores containing a small percentage of pyrites, found that where the ore received a thorough roast, the consumption of cyanide is decreased, and a similar effect has been noticed after roasting at the Florence mill of the American Reduction Co.

The size of ore leached varies from through a $\frac{1}{4}$-inch mesh at the Marion to through a 40-mesh at the Metallic Reduction Co.'s mill at Florence.

The vats are usually round, and vary from 9 to 26 feet in diameter and from 2 to 5 feet in depth. A few mills have all-steel tanks. In Utah many of the vats have sides of iron and wooden bottoms—a very satisfactory arrangement. Other mills have vats of pine, cypress or redwood, sometimes unpainted, but usually painted with paraffine or asphaltum paint.

The false bottoms consist of a frame of strips, or of boards, in which 1-inch holes are made, covered with jute or matting. Over this a No. 8 duck is sometimes used, especially if the tank is to be emptied by sluicing. In a few mills a gravel filter is used.

The method of leaching I find to be quite variable. The preliminary treatment includes the use of lime, caustic soda and sodium dioxide. Lime, when used, is mixed directly with the ore. In some cases the pulp is then washed with water until the lime is all washed out.

At other mills the solution is put on at once. Caustic soda is used in the same way, and also in solution as a preliminary wash. At the Commercial mill, Bingham, Utah, Mr. Stephens told me he had found that a preliminary treatment with a solution of sodium dioxide in water gave better results than either lime or caustic soda, and considerably decreased the time required for leaching.

Many mills begin the leach by admitting the solution at the bottom of the vat, until the ore is covered. The solution is then turned on top and allowed to run on at the top and drain off at the bottom simultaneously for a number of hours, the surface of the ore being kept covered. Very good results are obtained from this mode of treatment when the tanks are allowed to stand for a short time, after the pulp is covered, before the drainage valve is opened and the solution turned on top. This allows the whole mass to become thoroughly saturated and the slow drainage prevents the formation of channels. Any great depth of solution on top of the charge causes it to "pack," and an uneven extraction follows. In the Mercur district the ore is covered with solution, which is allowed to stand from thirty minutes to six hours and then drawn off. This operation is repeated from eight to thirty-five times. Here the material leached is so coarse that there is no danger of "packing." Each operation of covering takes from two to six hours. A few mills cover the pulp with solution, allow it to stand forty-eight to ninety-six hours, draw it off and wash. Many of the mills follow the strong solution with a wash of weak solution ($\frac{1}{10}$ per cent or less). This is in turn followed by a water wash, which flows through the zinc boxes into the weak solution tank, and becomes the first wash for the next charge.

A few mills warm the solution, and at one mill I found facilities for steaming the charge before putting on the solution.

The use of sodium dioxide in connection with cyanide, which is known as the Kendall process, has been adopted at a few mills. Prof. Kendall says that the better results are obtained by adding the freshly-made solution of dioxide to the cyanide solution; but many chemists claim that much oxygen is lost in this way, which is made available when the dioxide is mixed, dry, with the ore. The object of the dioxide is to furnish "nascent oxygen," which "acts on the cyanide to liberate cyanogen," hastening the reaction. My own experience with the use of dioxide has been that, in general, a greater extraction is obtained in a short time (twenty-four to forty-eight hours); but that at the end of a long time (seventy-two to one hundred and twenty hours) the extraction with dioxide is about the same as with cyanide alone.

The consumption of cyanide varies with the character of the ore and depends very little on the amount of gold and silver extracted. It varies from 2 pounds per ton, reached occasionally on Cripple Creek ores to $\frac{2}{10}$-pound on the Gilt Edge ore. The latter ore is an ideal one for the process, showing no indications of decomposed pyrites and the resulting acid compounds. Acid ores, although a preliminary treatment be given to neutralize the acid, consume more cyanide than others.

The consumption of cyanide in the zinc boxes varies with the strength of the solution, the length of time it is in contact with the zinc, and the amount of other salts in solution. Using a 1 per cent cyanide solution, and having mixed with the ore in the tanks an excess of impure lime containing alumina and magnesia, I have had as high as 3 pounds of cyanide per ton of solution consumed in the zinc boxes. Ordinarily, with a solution of 0.2 per cent KCy entering the boxes, the consumption is practically nothing. The strength rarely falls below 0.17 per cent KCy on leaving, and often shows no perceptible loss. A series of experiments made by the writer last winter indicated that the loss of cyanide in the zinc box is less when lime is used than when the acid in the ore is neutralized with soda, the excess of lime or soda and resulting salts not being washed out before the cyanide solution is added. The consumption of zinc, however, was slightly less when soda was used. This latter result was confirmed by Mr. Macgregor at the Congress mill.

The cost of "cyaniding" varies largely with the character of the ore. There are a number of mills which crush and "cyanide" ore for less than $2 a ton, exclusive of royalty paid to the company owning the patents. The lowest cost I have heard of is 85 cents a ton, at the Mercur. No company has yet been able to reduce the cost of treating tailings to the minimum reached in South Africa, 59 cents per ton; but one plant operating under exceptionally favorable conditions is working at a cost of 69 cents a ton. In general, the tailing plants working in this country do not obtain a high extraction.

There are a large number of tailing plants in the United States, especially in the southwest, where the hot, dry climate renders expensive buildings and drying machinery unnecessary. Including the output of these mills, I find that nearly 200,000 tons of ore and tailings were treated by cyanide in 1895, producing over $1,000,000 in bullion value.

Scientific Progress.

Emmens' Alchemy.

Several very reputable Eastern journals of a more or less scientific character have been for a number of weeks past giving considerable serious attention to the claim of Dr. Stephen H. Emmens that he has discovered a method for transmuting silver into gold. The London *Industries and Iron* pays its respects to Dr. Emmens as follows: "Dr. Emmens winds up this remarkable emanation with the declaration that he has already made forty ounces of gold from sixty ounces of silver, and that the metal responded to every test to which the United States Government assay office subjects the gold offered there for sale. In regard to the proceeding, where it will be seen Dr. Emmens claims not only that he can transmute silver into gold, but that he has actually already done so, the next step which would naturally follow the publication of a claim whose validity would be of such profound importance would be the production of some kind of proof that the claim was true. This is usually the difficult part of the matter in discoveries of this fundamental character; and Dr. Emmens' forms no exception. He is quite prepared to furnish infallible demonstrations of the bona fides of his transmutation process, but is unfortunately deterred by moral considerations which, if genuine, do him honor. Says he: 'I am of opinion that if such absolute, uncontrovertible proof were made public at the present time the effect would be to strike away the foundation of all commerce, and thus to cause widespread confusion and ruin to prevail.' This may or may not be so. The case, however, is that Mr. Emmens states publicly that he can convert silver into gold, but declines to attempt to prove his assertion, because if he proved it great confusion would be created. The obvious inference is that Dr. Emmens does not expect his own plain statements to be believed—rather a humiliating position for a scientist to voluntarily accept. He should either have accompanied his public declaration with the offer of proof, or held his tongue altogether. Scientific men, however, will not be inclined to place much credence in a process in the account of which such a farrago as the following is included. Says Dr. Emmens: 'What we use is mainly energy in some of its forms, such as heat, electricity, magnetism, gravity, cohesion, chemical affinity, X rays (!) and the like.' He further gravely informs us that 'energy is cheaply produced nodwadays, and may be had in any desired form by the combustion of coal.' We think that this piece of information might have been dispensed with, considering the ample margin there is for disclosures of a more interesting nature. There is no absolute impossibility in the feat which Dr. Emmens claims to have performed; but until he chooses to afford some practical proof, or at least some specific details of his procedure, must perforce earn his notoriety, or celebrity, at the expense of his character for veracity."

THE farmers of north Holland, says a correspondent of the *Gas World*, have come into possession of a very interesting source of lighting. About forty years ago borings for water in the polders around the Haarlem lake, at farms below the level of the surrounding sea, brought up inflammable gas; but, as this gave no light, it was neglected. Now, however, this gas is being systematically bored for, and it comes up mixed with sweet water, making this water effervesce. The effervescing water is brought under a gas holder, and the gas is liberated while the water flows on. About 6 cubic feet per hour are thus collected from each boring, and the singular result is that many outlying farms, away on the polders of north Holland, below sea level, are brightly lit up at night by incandescent burners.

A NEW source of vanadium compounds has been found on the South American Andes. On one of the high plateaus a mine of anthracite has been located, which, when burned, leaves an ash containing vanadium and silver. The vanadium is now being extracted for use in making aniline black and coloring porcelain.

A STATISTICIAN has learned that the annual aggregate circulation of the papers of the world is calculated to be 12,000,000,000 copies, says the *Northeastern Lumberman*. To grasp any idea of this magnitude we may state that it would cover no less than 10,450 square miles of surface, that it is printed on 781,241 tons of paper, and, further, that if the number 12,000,000,000 represented, instead of copies, seconds, it would take over 333 years for them to elapse. In lieu of this arrangement, we might press and pile them vertically to gradually reach our highest mountains. Topping all these, and even the highest Alps, the pile would reach the magnificent altitude of 490, or, in round numbers, 500 miles. Calculating that the average man spends five minutes reading his paper in the day, we find that the people of the world altogether annually occupy time equivalent to 100,000 years reading the papers.

THE late Dr. Brown Goode made the following comparison in a report of the United States National Museum: "There is not a department of the British Government to which a citizen has a right to apply for information upon a scientific question. This seems hard to believe, for I cannot think of any scientific subject regarding which a letter, if addressed to the scientific bureaus in Washington, would not receive a full and practical reply. It is estimated that not less than 20,000 such letters are received each year. The Smithsonian Institution and National Museum alone receive about 6000, and the proportion of these from the new States and Territories, which have not yet developed institutions of learning of their own, is the largest. An intelligent question from a farmer of the frontier receives as much attention as a communication from a royal academy of sciences, and often takes more time for the preparation of the reply."

TECHNICAL society work has never received nor merited such appreciative attention as at the present time. Changes in processes and methods, wastes and economies in production, and the extension of services and uses are being so ably discussed, and the methods for giving publicity are so numerous, that what is said by the Western Foundrymen's Association of Chicago one week is heard in London the next. The world is wiser and better to-day for such associations, and the fraternizing effect the world over is vastly enlarging class scope. The annual congresses of American technical societies are becoming almost historic in their importance, and those to be held between now and the new year embrace interests that are a vital part of the industrial integrity of the United States.—Chicago Journal of Commerce.

THE spontaneous combustion of coal on ship board is attributed by Emanuel Stauber of Hamburg to a combination of causes, including the admixture of air and moisture with the gas exhaled by coal, together with the heat generated by the internal friction of the heaps from the rolling of the vessel. This has led him to patent a method of ventilation having the threefold object of drying the coal, removing the evolved gases, and preventing the mass from moving about. His plan is to perforate the floor of the hold and to set up a pair of perforated walls down the center, thus forming an air space in the form of an inverted T, which is connected with a double ventilating cowl on deck. In addition to the partition walls a number of movable perforated pipes are to run from the central shaft transversely through coal at different heights.

Mechanical Progress.

A Hot Blast System for Copper Matting and Silver-Lead Furnaces.

The following is from advance sheets of a treatise on the above subject by Mr. J. W. Nesmith, president of the Colorado Iron Works:

The cut herewith presented illustrates a system of heating air for silver-lead blast furnaces, copper matting and pyritic furnaces and consists essentially of a suitable chamber through which the air passes on its way from the blower to the furnace, and within this chamber in the atmosphere of the air blast an open fire of gas or oil is kept burning, the heat from which is absorbed by the passing air blast and carried thence into the furnace. With these conditions some very important considerations are involved. The products of combustion in the stove mix and go forward with the heated air into the smelting furnace, thus reducing the proportionate amount of oxygen blown in by the amount consumed in the stove. Carbonic acid gas now becomes a constituent of the air blast in proportion as oxygen has been consumed in heating it; but as the ultimate value of oxygen consumed has been utilized in heating the air, and that heat has gone forward into the furnace, it follows that just so much less oxygen is required in the furnace for the purpose of oxidizing fuel for heat production there and no loss is sustained in the attenuation of the air by the amount of carbonic acid gas, which mixes and goes forward with it. The aggregate amount of carbonic acid gas at the tuyere zone has not been increased, nor has the aggregate value of oxygen supplied with the air blast by the blower been diminished.

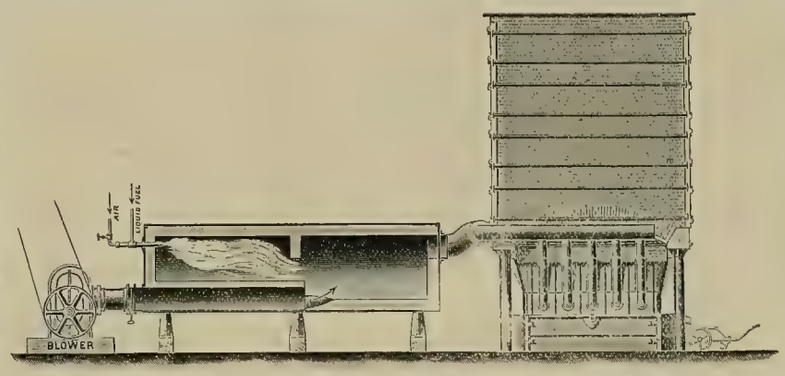
Hot air, when attenuated in the proportion of oxygen it carries by the amount of carbonic acid gas produced in heating it, does not tend to concentration of combustion and resultant unduly high temperature at the tuyere zone, which is to be avoided in copper matting or pyritic and lead smelting. Conditions at the incandescent zone above the tuyeres for oxidation and reduction are controlled by volume, temperature and pressure of blast with reference to cross section of the furnace at the tuyeres, character of the material being operated upon, and end results to be accomplished. In the use of hot air, provision must be made in tuyere area to accommodate and allow the passage of its vastly expanded volume. If the air pipes and tuyeres are not proportioned to it, then necessarily at a given pressure of blast there may occur a localization of combustion simply by reason of the limited amount of oxygen supplied through them, which at once combines with the first carbon or other fuel with which it comes in contact, leaving less or none for other fuel in the same zone and above.

Heating the air blast, by reason of its vastly increased volume, tends to facility of distribution and not to localization of combustion. Pure oxygen blown in at the tuyeres would produce most violent local combustion and most intense heat. Nature attenuates oxygen by the admixture of a trifle more than four times its volume of nitrogen, and the product becomes air and is susceptible, physically by well-known means, of a much wider distribution and contact with the material and a corresponding distribution of resulting combustion in the tuyere zone. Increasing heat invests oxygen with the property of accelerating energy and intensity which would tend, if blown in hot, to violence of reaction with carbon, sulphur, iron, etc., concentration or localization of combustion and resultant excessively high temperature, were it not for the counteracting factor that nature again provides in the expansibility of gases under heat which has the same material effect of an attenuating or thinning down of the air by increasing its volume, components remaining unchanged, the increased energy of its oxygen by reason of heat, being counteracted or compensated for by its expanded volume, and hence facility of distribution, prevents undue local action. The reactions peculiar to the zone of fusion do not, however, occur until the air blown has reached the temperature of that zone and the oxygen has hence acquired its extreme energy, therefore the only effect of heating the blast on the action of the furnace is to make uniform action possible where it enters the furnace by eliminating much of the cold otherwise carried in by the air blast and circulated or distributed irregularly and without control. When the air is heated to 553 degrees F. from 62 degrees normal atmosphere, its volume has been doubled and the facility for its thorough distribution and exposure throughout the tuyere zone is doubled, and so on proportionately to 1045 degrees it is trebled and to 1535 degrees where it has four times its original volume. In the exact proportion that a given quantity of air is increased in volume by heat, the practicability of its thorough distribution and contact with every atom of exposed material, and hence of uniformity in degree of combustion at the zone of fusion and in the desired conditions throughout the other auxiliary zones respectively, is realized.

If comparatively high blast pressure through tuyeres relatively small, carrying no air in excess of that used for combustion at the tuyere zone, then there occurs a localization of combustion and consequent heat, and all material within that zone is quickly melted down with little change in grouping of constituents, while such carbon monoxide evolved as may escape oxidation there absorbs oxygen from the oxides in the hot zone above and thus reduction results. With large volume of air blast at lower pressure, the oxidation of fuel is more gradual; the action at the tuyere zone is less intense, and while a melting temperature must be maintained at that point, a surplus of heated air must pass on to the next layer or cross section above, where, by thorough exposure for sufficient length of time and in the presence of adequate heat, oxidation takes place more or less rapidly, depending on character of material operated upon, and the equable proportioning of the conditions named above.

Hot wind does not necessarily tend to concentration of temperature and rapid smelting, though it makes either the one or the other, or both, possible, when pressure temperature and volume are under control to adapt all to size and shape of furnace and character of ore being smelted. Cold, purely as cold in the air blast introduced for the purpose of producing any modifying effect on a zone of the furnace where incandescence is a normal and necessary condition, is an absurdity.

A part of the air sent to a blast furnace is for the purpose of generating heat by the burning of fuel to raise the temperature of material within the furnace to a point at



HOT BLAST STOVE FOR SILVER-LEAD SMELTING AND COPPER MATTING.

which it is possible for the desired chemical reactions to take place rapidly, and further to melt such material when it reaches the tuyere zone, while another part is required for the oxidation of fuel necessary for those reactions, or else for its oxidizing effect higher up in the furnace on ores carrying sulphur, iron, etc. There are large proportional areas, especially in the neighborhood of the tuyeres, in every cold blast furnace in which the desired reactions cannot take place because the blast keeps these areas too cool to admit of them. Proportionally as the air is sent hot into the furnace these cool areas are reduced of size and in far greater proportion is the capacity and the efficiency of the furnace increased. Zinc crusts and other accretions of kindred nature obtrude less difficulties to combat when not complicated by the presence of cold inactive spots produced by the cold of the blast. A pound of carbon requires 11.6 pounds of air for its consumption, and conversely for each pound of carbon that is saved from burning in the furnace by burning it in contact with the blast before it reaches the furnace, the cooling influence of 11 6 pounds of cold air is kept out of the zone of intense heat, as much cold in the air blast to be overcome by heat to be developed from each pound of carbon as would be required to melt 32 lbs. of pig iron from atmospheric temperature, and it is by far better to relieve the furnace of at least a part of the duty of heating in its most vital part such enormous quantities of air to burn fuel for the production of heat that may more efficiently and cheaply be produced outside and carried in with the air blast.

Hot air is a most potent factor in facility of control in furnace working Eliminating the element of cold from the air blast removes the one unmanageable factor in blast furnace smelting. If the current of cold air could be kept constantly impinging on glowing coke, then to overcome its cooling influence would be only a question of fuel added; but it is not so; it is unmanageable because the course or direction of the air when it enters the furnace is largely determined by the dark areas or patches of cold material, rendered so by the cold of the air blast and against which it impinges.

If in any particular zone of the furnace a given condition of temperature, oxidation of fuel and incandescence is desirable, then that condition is desirable in the whole of that zone, and the cooling in spots and patches in cross section by forcing a blast of cold air into it curtails the area and the efficiency of that zone, not only by the amount in relative proportion of those abnormally cooled spots or patches to the whole zone under consideration, but by far more than this, for they lie there in the way of the blast, obstructing and preventing it from circulating freely throughout the incandescent zone, which it necessarily should do for the requisite supply of oxygen to each and every individual inch in that section, and not only is the room they occupy lost absolutely and to be deducted from value of cross section, but their adverse effect on its operation by deflecting the blast upward or downward, anywhere away from where it is needed to where it is not needed, is still more serious, for no possible good but much harm must come as a result of blast blown against cooled masses of furnace material and deflected thence upward or downward or athwart into material from which heat is obstructed by the cool areas. It is only the air that gets around these cooled spots in some way and into the burning fuel, and is then heated, that does effective duty.

An illustration from an old chemistry text book applies, to-wit: a candle is blown out with a breath because the wick and the wax are cooled and the oxidation of the carbon cannot go on. Submit it to a blast of air as hot as the flame of the candle, and it will not be blown out, but will still burn.

In like manner and for like reason combustion may be stopped and the smelting operation ended by a very violent blast of cold air in a furnace burning carbonaceous fuel, and it is for this reason that very large furnaces cannot be operated with cold blast. Whenever the furnace is so large that the blast pressure must be increased to several pounds in order to permeate the center of the whole mass of furnace material at the tuyere zone to maintain combustion there, then the excess of cold extinguishes the fire, blows it out, as it were, in continually widening areas in the neighborhood of the tuyeres, where it is introduced, and for distances inward greater and greater as blast pressure is increased, but in patches or spots only of greater or less area, until the center is reached and cooled so much as to stop the smelting operation all along the center line; the half-melted mass of unsmelted material cools more and more, growing larger and larger until it is finally connected here and there with the cold patches between the center and the sides, and now excessive irregularities are culminating in a frozen-up furnace, often solid at the center while yet partially open along the sides.

Air is delivered into a blast furnace at its hottest part—the zone of fusion—the tuyere zone. It follows that to perform its functions its temperature must first become the same as the temperature of that zone. It is not to be admitted that any other than that temperature adapts it for its offices there, else why blown onto that hottest zone, or else why has that zone such temperature? It is not for a moment to be supposed that some other, some lower, temperature suits the air to its duties as a factor in furnace operation; that it may be better blown in cold and allowed to warm up to its work, and that it could perform its office efficiently and reliably when submitted to such fortuitous conditions in its warming up, one part of the air blast impinging on or blowing into the fierce heat of glowing fuel, where the excess not required to support combustion at that point is heated instantly to the highest burning temperature, possibly 4000° or more, oxidizing rapidly any reduced lead with which it may come in contact; another part landing against some cold, dark spot and thence deflected against some other cold, dark area, thence dodging around until it does get into the heat somewhere, often far above the proper smelting zone, and having finally acquired the heat necessary, it performs its offices in conjunction with fuel at that point, producing heat and setting up a temporary smelting area above the normal one. Thus is the proper smelting zone robbed of a part of the air necessary to its appropriate reactions and further chilling ensues, while the smelting zone is extended upward and rendered inefficient throughout its whole extent. The air must reach the temperature at which the desired reactions take place before it can become a factor in these reactions, and hence the proper temperature of all the air in any zone of the furnace is that at which the reactions peculiar to that zone take place, and because air blown into the zone of incandescence can only perform its appropriate functions there when at the temperature of that zone, the nearer to that temperature it is when it reaches there the less disturbance and irregularity it will create in that vital section.

Hot blast contributes to support the combustion of carbonaceous and other fuel, as sulphur, etc., with a minimum of oxygen supplied, i. e., the hot blast and fuel are drawn upon most for the necessary smelting reactions and least possible for heating per se. Heating the blast promotes regularity of heat and of chemical reaction by promoting uniformity of conditions throughout each individual section of the furnace, especially in the zones of incandescence and fusion where the most active changes are taking place, reduction or oxidation predominating, as the case may be, both in that zone and above. Reducing the amount of air necessary to be forced into the furnace to burn fuel for the promotion of heat, in that proportion is reduced the probability of excessive lead oxidization in silver-lead smelting, and it does not in the least tend to increase oxidation of lead by reason of the heat it carries with it, so long as initial blast temperature is below the necessary temperature of the furnace at that zone where it enters. On the contrary, by reason of the uniform conditions made possible and promoted by the heated air blast in the various zones of the furnace respectively, especially that at the tuyeres and that one of incandescence next above the tuyere zone, the probability of excessive oxidation of lead is much further reduced. It utilizes a less expensive fuel for the production of that part of the heat that may better be carried in by the blast, and it realizes the full caloric value of that fuel, sending the whole resultant heat into the furnace. Because the blast is heated it does not follow that the furnace need be, or would be run hotter than is common or desirable. Hot blast does not necessarily involve increased temperature in any zone of the furnace. Incandescence at the tuyere zone where the air blast enters, is a necessary condition of every blast furnace, but the temperature of the heated blast being always below that of incandescence, the heat of that zone and of the whole furnace is within easy and accurate control.

In matte smelting of sulphide ores that require previous partial roasting and where carbonaceous fuel is used, the tendency is to reduce iron oxide and sulphurous acid by excess of carbon monoxide and to produce a poor matte, because the carbon monoxide in the first instance robs the FeO of its oxygen to form carbonic acid gas, thus robbing the slag of the iron needed there and sending it to the crucible to burden the matte, and in the second instance the sulphurous acid which would otherwise escape by the chimney is robbed of its oxygen, thus producing sulphur and sending that also to the matte. The less carbonaceous fuel necessary to be burned in the furnace, other conditions being right, the less imminent become these undersirable reactions, and hence the more of the necessary heat that is generated outside of the furnace and sent in with the air blast, the more favorable are conditions in this view of the case to a higher percentage of concentration of valuable products in the matte, and the suggestion points significantly to pyritic smelting.

To the application of hot blast is due the great economy and efficiency realized in modern iron smelting practice, for it is the application of heated blast that has made the great iron furnaces of today possible. Blown with cold blast not one of them could run a week. Heated blast, making uniform conditions of combustion and of consequent reactions, possible in each individual cross section of the furnace, has made high blast pressure possible, without which furnaces of large cross section area could not be blown and this in turn makes deeper ore columns necessary and hence higher stacks. There is no condition of blast temperature applying in iron smelting that does not apply with equal force and effect in lead smelting for gold and silver, in copper matting and in pyritic smelting. Localization or distribution of heat, according to conditions demanded by the reactions sought to be realized, are accomplished by formulating suitable relative proportions of air temperature, pressure and volume, cross section of the furnace at the tuyeres and general dimensions, with a certainty and regularity not possible in cold blast smelting.

Electrical Progress.

In a paper read before the Pennsylvania Street Railway Association, F. W. Darlington, speaking of electric railway motors, said: "So far as the motor alone is concerned, there is no longer a possibility of doubting its ability to do the work of a steam locomotive. It can make a car move as fast and faster. It can pull heavier loads, by reason of its power being supplied from some exterior source, and, hence, having practically an unlimited supply, it can climb steeper grades, and it can reduce expenses. Can more than this be asked of it? I think not. There remains, however, the question of how to transmit the electricity from the stationary engine and boiler plant to the motor on the car. It has been proven beyond doubt that power can be developed in a stationary powerhouse at a large saving of coal and other expenses. Of this fact, and that of the ability of the motor to do all the work demanded of it, there is no difficulty in convincing the steam railroad man. But the inability to prove beyond a doubt that the power can be transmitted satisfactorily for long distances is where the failure lies. This is the one point to be worked out and demonstrated before there will be any general adoption of electricity for long distance roads."

At the Liverpool meeting of the British Association for the Advancement of Science, the president, Sir John Lister, Bart., D.C.L., in his address, speaking of the Roentgen rays, said: "Mysterious as they still are, there is one of their properties which we can all appreciate—their power of passing through substances opaque to ordinary light. There seems to be no relation whatever between transparency in the common sense of the term and penetrability to these emanations. The Roentgen rays cause certain chemical compounds to fluoresce and emit a faint

light plainly visible in the dark, and if they are made to fall upon a translucent screen impregnated with such a salt it becomes beautifully illuminated. There is no reason to suppose that the limits of the capabilities of the rays in this way have yet been reached. By virtue of the greater density of the heart than the adjacent lungs with their contained air, the form and dimensions of that organ in the living body may be displayed on the fluorescent screen, and even its movements have lately been seen by several different observers. * * * The important applications of the new rays to medical practice have strongly attracted the interest of the public to them, and I venture to think that they have even served to stimulate the investigations of physicists. * * * There is another way in which the Roentgen rays connect themselves with physiology, and may possibly influence medicine. It is found that if the skin is long exposed to their action it becomes very much irritated, affected with a sort of aggravated sunburning. This suggests the idea that the transmission of the rays through the human body may be not altogether a matter of indifference to internal organs, but may, by long continued action, produce, according to the condition of the part concerned, injurious irritation or salutary stimulation."

AT a meeting of the American Institute of Electrical Engineers, President Louis Duncan of Baltimore read a paper on "The Present Status of Power Transmission," in which a number of the longest transmission schemes now in operation were reviewed. All of these, except the transmission at Geneva of 20 miles, were by the polyphase system. The longest was 35 miles. The highest voltage used, alternating current, was given as 13,000 volts, but M. Thury's direct-current transmission at Geneva employed a voltage of 15,000. As to the distance to which current could be sent commercially, the author believed that fifty miles at 30,000 volts would be practicable, provided the power could be sold at a profit. In long distance transmission for railroads he was very dubious of the outcome. If attempted, it would have to be by means of high potential alternating currents feeding rotary transformers located at frequent intervals along the line. The demand on any given section of a road of this kind varied between such very wide limits that the economic problem involved became quite a serious one, and he did not believe the storage battery had yet been made that, with reasonable outlay, could meet this demand.

UNDER the agreement made between the American Bell Telephone Company and the Western Union Telegraph Company, payments have been made as follows during the years named:

1881	$ 94,000	1889	$ 511,000
1882	100,000	1890	575,000
1883	246,000	1891	614,000
1884	354,000	1892	648,000
1885	396,000	1893	690,000
1886	404,000	1894	460 000
1887	433,000	1895	296,284
1888	467,000		
Total			$6,368,284

This agreement was brought about by the Western Union retiring from the telephone field and turning over to the American Bell Company its patents, chief of which were those of Thos. A. Edison.

IT is reported that Warden Coffin, of the Ohio State prison, is having difficulty in buying an electric plant to carry out the electrocution law. None of the manufacturers will take an order for such a purpose.

IT is announced that Herr Dorman, of Bremen, has succeeded in photographing objects by Roentgen's method through iron plates twenty-two centimeters thick.

IN 1865 the eleven street-car lines in New York carried 80,000,000 passengers in a twelve-month. In 1875, 13 lines carried 140,582,793; in 1878, 15 lines carried 169,105,739; in 1883, 15 lines carried 266,164,236; in 1893, 16 lines carried 453,652,064. It is estimated that the traffic for 1896 will not be far from 1,000,000,000 passengers.

Practical Information.

The Future of the Sahara.

M. Bonnel de Mezieres, member of the Maistre and Attanoux Missions, has, says the London *Daily News*, expressed his opinion on the future of the Sahara, to the effect that there is no doubt that immense sand ocean will be in time changed into a fruitful territory. He says:

"The Sahara rivers which I have crossed all hide a rich subterranean stratum of water, and form the natural passages to the Soudan, on which, with very little trouble, vegetation can be largely developed. In the south of Temassinin and in the Igharghars there are groves of tamarind, gum trees, etc., of two miles long, scarcely separated by grassy and clover-covered plains. The rivers, which in spring are full of water, are from three to ten miles wide. When the water retreats, the beds of the rivers are changed into rich meadows. The date seeds planted by Flatters at El-Biod have grown without the least care into fine trees, and the same is the fact also of the seeds planted near the cisterns of Tebalbalet, in spite of the inconsiderate manner in which the Tuaregs get in the harvest. Trees are not so rare in the Sahara as is supposed. The Tuaregs often assured our expedition that we should have to march for two or three days without finding water, but very soon we found a little out of the path some filled up or otherwise purposely hidden wells. For the Tuaregs, who serve as guides to caravans, always choose the most difficult and desolate routes, in order to keep the caravans in a state of dependency. Caravans will become more frequent; travelers will succeed each other, but the secret of the Sahara is well kept, and its reputation of barrenness is still preserved. When Lieut. Hourst and Lieut. Bluyet explored the region and an arm of the Niger they found a lake nearly 100 miles long. And when the officers of the Timbuctoo extended their excursions, they found that not only one, but more than twenty, lakes existed—all very large, and stretching far to the north into the very heart of the supposed arid Sahara. If there be no water, and therefore no vegetation, where does the charcoal come from which is sold by the Tuaregs? Where do they find nourishment for the numerous camels, horses, sheep, asses and goats they possess?"

THE large number of torpedo boats now being built for the U. S. Navy brings forth some features in machinery exceptionallv interesting and novel. On some boats of this kind recently launched the equipment of steam pumps, as well as the main engines, are run without the use of oil in the steam cylinders. While this is not a new idea, so far as vertical steam engines are concerned, it has never been the practice to run steam pumps without oil. The pumps are arranged without any oil holes whatever, so that it is impossible to get oil into the steam cylinders. These pumps were given an exhaustive test for several days by the manufacturers and they operated with entire satisfaction, and without using a drop of oil. The doing away with the use of oil in the steam cylinders of a vessel is a matter of considerable importance, as there is no necessity of carrying feed-water filters and no anxiety about oil injuring the boilers.—Scientific Machinist.

IN 1895 there were 251 life-saving stations on the Atlantic, Gulf and Pacific coasts and on the Great Lakes, by far the greater number, 184, being located along the Atlantic coast line. There is but one station on a river, at the Falls of the Ohio, Louisville, Kentucky. The number of disasters happening to vessels on these coasts during the year was 675. The property involved was of the value of $10,725,175, of which nine-tenths was saved by the life-saving service, salvage companies and wrecking tugs, working in conjunction. The lives which were threatened by these disasters numbered 5823. Of these only 26 were lost. Of the saved, 800 were succored at the stations. The number of vessels totally lost was 73 of the 675 that were in jeopardy. On the New Jersey coast, which was guarded by 49 stations, nearly 1000 persons were on board vessels which were in danger and only one person was lost, and of more than $2,000,000 worth of property in peril only $83,535 was lost.

Canals a Success.

The Suez canal, which has now been in operation for more than twenty-five years, was during the first year patronized by only 486 vessels, with a total net tonnage of 436,609. In 1880 the net tonnage was 3,057,421 and in 1890, 6,890,094. It is estimated that the tonnage for 1896 will be above 9,000,000. The total cost of the canal was about $100,000,000, or $1,000,000 a mile, and since then expenditures have been incurred for improvements amounting to some $40,000,000 more. But the enterprise is so profitable that it pays not only the fixed interest of 5 per cent on all its bonds, but from $4,000,000 to $5,000,000 a year in addition, as dividends to shareholders and bonuses to employes.

The Manchester ship canal has been in operation less than three years, during which trade conditions were none of the best, but it has nevertheless been a success. In its fifth half year the sea-going traffic amounted to 668,000 tons—an increase of more than 154 per cent compared with the figures for the first six months. There is every indication that the increase will continue, as the canal has saved Manchester merchants a great deal of money each year by reduced railway rates and lower charges of shipping firms at Liverpool. Thus we have two instances in which internal waterways became a decided success in spite of the predictions of failure that were so freely made.—American Manufacturer.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.

Operator and Dealer in

Mines, Mining Properties and Mineral Lands,
Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES.

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

A Position Wanted

By a Practical Mining and Mill Man, a party having had sixteen years of experience on the Comstock and fifteen years in California gold mining and milling and understands the practical mining and milling in every branch and detail. He is also a first-class accountant. The best of references given. No objection to going into foreign country, as the party speaks English, German, French, Spanish and Dutch.

Address "Practical Miner,"
Care of Mining and Scientific Press, S. F.

WANTED,

A position as Superintendent or Assistant Superintendent in copper-silver or silver-lead smelting works.

Understands mining, sampling, assaying, furnace management, handling men.

Prefer Mexico or Spanish South America. Speaks Spanish. Best references.

Address METALLURGIST, this office

You pay

a trifle more for **good** furniture; it'll out-last "cheap" furniture several times.

Isn't that your idea of economy?

A hint at values:

Solid oak dining-room table, like picture, 8 feet long, highly polished, $17.

A cent buys a postal card and brings you our new catalogue. Good investment; tells about money-saving furniture.

California Furniture Company.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FAUCET AND AIR INLET ATTACHMENT.—Charles L. J. Pokrantz and Jules Ch. de St. Hubert, San Francisco, Cal. No. 568,921. Dated October 6, 1896. This invention relates to a faucet and air inlet attachment for demijohns, casks and other vessels containing wines, and a means for preparing the air which is admitted into the vessel so that it will not affect the wine and cause it to deteriorate. It consists essentially of a tube or passage leading from the interior of the vessel to the outside substantially parallel with the faucet shank, having an air inlet at the outer end to admit the air to the vessel, a readily removable casing to be seated upon the shank and fitted over the outer end, and means for supporting a body of pulverized material within the casing and over the air inlet of the tube so that the air is filtered before being admitted into the vessel.

ADJUSTABLE SLIDING AND SWINGING WINDOW SASH.—E. S. Barney, San Francisco, assignor of one-third to A. T. Dewey, same place. No. 569,146. Dated October 6, 1896. This invention relates to that class of sashes which are adapted to ordinarily slide in vertical guides in the casing, and which are also adapted to be hinged so as to be temporarily opened inwardly from the casing so as to obtain access to both sides of the window. It consists essentially of the combination with a window sash of a cord retainer vertically slidable between the edge of the sash and the casing, having its upper end adapted to contact with a stop on the casing when the sash is at the top, whereby the sash is relieved of the pull of the weights, a transversely sliding bolt movable on the sash with its point adapted to automatically engage a slot in the cord retainer when in line therewith and a notch in the bolt which locks it in engagement with the retainer and prevents its withdrawal until the retainer contacts with the stop and allows the sash to move upward enough to disengage the lock. A removable stop is also employed which may be secured at various points on the casing where it may be desirable to stop the cord retainer.

MACHINE FOR GROOVING BOOT OR SHOE SOLES.—George Bryant, San Francisco, Cal., assignor to Alice Elizabeth Bryant, same place. No. 568,892. Dated October 6, 1896. This invention is designed to form transverse grooves in the leather of which boot and shoe soles are formed so as to render the soles pliable, while retaining a sufficient thickness of leather to render them moisture resistant and to give good wearing qualities. It consists of a gang of saws adjustably fixed upon a saw arbor, mechanism by which the saws and arbor are rotated, a corrugated roller, the shaft of which is journaled in vertically adjustable boxes above the cutters so that the material to be grooved is passed between the roller and the cutters, and in conjunction with this tension screws which press against the rollers so as to retard the rotation and cause the material to move at a rate of speed less rapid than that of the cutters.

Obituary.

MONROE GREENWOOD died at his home in San Mateo last Sunday of heart failure, at the age of 68. Mr. Greenwood came to California in 1851 and has long been prominently identified with important interests. At the time of his death he was president of the California Electrical Works and vice-president of the Sunset Telephone and Telegraph Company.

Coast Industrial Notes.

—The members of the State Bureau of Highways have in contemplation a bill to be presented to the next Legislature creating a State highway from the northern to the southern boundary of the State.

—The Ventura oil refinery has fired up for the first time in four months, and the manufacture of petroleum products been begun along enlarged lines. The differences which resulted in the closing down of the plant have been adjusted, and all claims against the original company have been satisfied in full.

—It is understood that the Federal Government has decided in favor of the Smith's Cove route for the canal connecting Lake Washington and Puget Sound. It has been generally understood that the Sound outlet would be by way of Salmon bay, but the chief of the Bureau of Engineers states that the Secretary o the Interior has definitely decided in favor of Smith's Cove. By this decision the canal is brought within the city limits of Seattle.

—All the real and personal property of the Redwood City Electric Company has been transferred to the Peninsula Lighting Company at Redwood, San Mateo county. The new company is a San Francisco corporation. This plant is at present furnishing incandescent lights to the residents of San Carlos from Redwood City, and poles are erected to Menlo Park. The new company has the material on hand for extending the system to Woodside and to Mayfield and Palo Alto in Santa Clara county.

Recently Declared Mining Dividends.

Utah, Utah, $2000, payable October 20th.

Galena, $5000, payable October 15th.

War Eagle Gold Mining Co., British Columbia, $30,000, a total of $197,000.

Bullion-Beck, Utah, $30,000, payable October 15th; total since January 1st, 1896, $215,000; total since organization, $2,165,000.

Swansea, Utah, $5000, payable October 20th.

Mercur, Utah, $25,000, payable October 20th. This gives a total of $525,000.

Portland Mining Co., Colorado, $30,000, payable October 15th.

Mount Rosa Co., Colorado, $5000, payable October 15th.

Anchoria-Leland, Colorado, $6000, payable October 15th.

Personal.

T. C. SCHRADER, J. E. Spurr and H. B. Goodrich of the United States Geological Survey, who have been in Alaska making an examination of the gold fields of the Yukon, have returned to this city.

J. H. TIBBITS, who recently returned from South Africa, and has been staying at the Palace Hotel for some weeks, has left for Arizona to inspect some mining properties and will return in about two weeks.

Recent California Mining Incorporations.

Cascajo Gold Mining Company, San Francisco. Rudolph Jordan Jr., Hugh Craig, San Francisco; John Somerville, Philip C. Musgrove, West Point, Calaveras county; John F. Smith, Alameda. Capital stock, $1,000,000; all subscribed.

Daphne Gold Mining and Development Company, San Francisco. Richard E. Kelly, Herman Zadig, Alameda; James K. Cosgrave, Adolph Greenfield, San Francisco; Frank H. Waddell, Trinity county. Capital stock, $500,000; subscribed, $1,100.

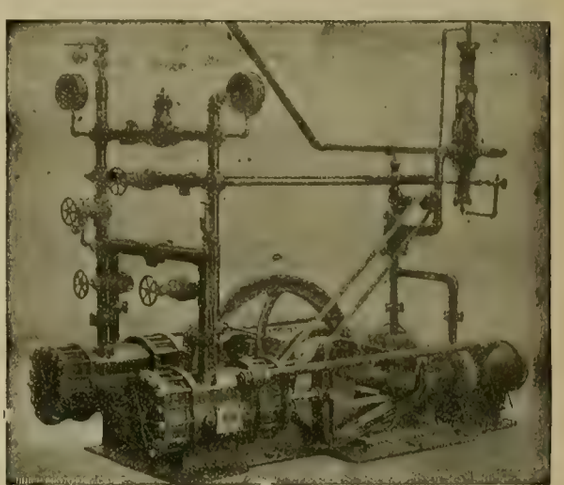
DOUBLE PIPE AIR COMPRESSOR.



This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

WHITE, ROGERS & CO.,
Constructing Engineers and Millwrights,
NO. 306 PINE STREET, - - - - - - - - - SAN FRANCISCO, CAL.

We furnish the machinery and erect at the mines all descriptions of **STAMP MILLS** for the economical treatment of gold and silver ores. **HOISTING AND PUMPING MACHINERY**, operated by Steam, Water, or Electric Motors. **CYANIDE, CHLORINATION AND LEACHING WORKS. COMPLETE CONCENTRATING AND SMELTING PLANTS** for dressing lead ores and smelting for copper and silver. **IMPROVED AIR COMPRESSORS AND DRILLS. WIRE ROPE TRAMWAYS** for transporting ores; **ETC., ETC.**
✦✦✦ **Practical Working Plans and Specifications Provided for All Machinery Furnished or Structures Built By Us.** ✦✦✦

Mining Summary.

CALIFORNIA.

Amador.

Ledger: The purchasers of the Lighthouse mine have extended the tunnel and crosscut the ledge. They have cut a 22-inch ledge of good gold-bearing quartz which shows free gold. The owners of the property intend to erect a 5 or 10-stamp mill immediately.

Robert Reed is prospecting on the Rocky Ford, where he is crosscutting a ledge and is in 50 feet without finding the walls.

C. C. Clark and John L. Madden have made a deal with Bailey, Porter, Bailey & Co. of San Francisco by which the latter have, for about $200,000, secured the Maximilian, Hayden Marre and Allen properties, above Sutter Creek, consisting of about 230 acres. They are going to work immediately, having already contracted and arranged for about $50,000 worth of machinery.

Amador *Record*: The Potayuba Mining Company has let a contract for a hoisting plant.

Dispatch: I. N. DeWitt has commenced a tunnel across the gulch from the mill of the Amador gold mine to run 1000 feet into the hill to strike a ledge which crops out at the top of the ridge.

Republican: The Union Consolidated Mining Company are running 10 stamps of their mill, and the mill will be running to its full capacity in the near future. The men are sinking and preparing to work the mine to its full capacity.

Butte.

At the Golden Feather, under the management of George H. Evans, a new elevator patented by him is now being used on the ground, and the work it is doing is phenomenal in stripping the reaches in the upper section of the claim to bedrock. The ground in this portion of the Feather is very difficult to handle, owing to boulders of enormous size, and the worst of it is that so far the territory covered has all been worked before in early days. Mr. Evans thinks, however, that he is now nearing the head dam of the last pioneer venture of the kind, and from that on it is expected that the returns will be high enough to remunerate the company for its large outlay of money in the works.

Development work in the Banner mine is being pushed forward as rapidly as possible in order to reach the pay chutes on the 800-foot level, 900-foot level, 1000-foot level, including winze, and therefore low-grade ore only is being milled, the cleanup from which will be small.

Oroville *Mercury*: It is reported that the Princess mine has changed hands, and a new company organized.

At the Diamond mine, at Mountain Cottage, $10,000 worth of new machinery has been received, and they are working twelve men on good ore.

Henry Turner, of the Big Bend mine, has 100 Chinese miners under his charge at river mining.

The Clarke mine, near Big Bend, which has been running by arrastras, has shut down on account of lack of water.

Many prospectors are at work in Hubbard's flat, near Big Bend, and good wages are made by many.

At the William Pinkstoun quartz mine five stamps are running night and day.

Calaveras.

Angels *Voice*: A new hoist is being built at the Thorp mine. Two hundred feet will be sunk at once.

Colonel Woodrow has purchased a new engine, boiler and other machinery for the Santa Anna mine on Albany Flat.

Chronicle: A company of San Francisco capitalists are operating the Sand Hill gravel mine near Camanche. A greater depth than ever has been reached on the channel, and the pay gravel is said to be 35 feet in width. Extensive machinery is soon to be put on the mine.

Sinking at the South Paloma mine is going steadily ahead. The shaft is now down over 200 feet. Steam power is used.

Prospect: The 10-stamp mill at the Fellowcraft mine at San Andreas has been started up. This property was sold last May by Col. E. C. Culp to A. J. Weatherhead, W. P. Sargeant, S. Prentice Baldwin and Prof. P. L. Hobbs. The main shaft is down over 230 feet, with a ledge varying in width from 5 to 10 feet, while the ore throughout prospects well. There is a 40-foot hoist, capable of sinking the shaft to a depth of 1200 feet. There is also a complete electric light plant for lighting the mine and buildings as soon as required. The hoist is run by water power, while steam is the motive power for the mill.

The tunnel of the Hexter Mining Company, near Mokelumne Hill, has reached a depth of 700 feet. It is estimated that 3000 feet will have to be driven before the channel is reached. This channel is probably the largest in that part of the county and the gravel was always found to be very rich wherever it was tapped, but on account of the great depth to the bottom of the channel, and the perfect river of watar encountered, the channel could never be worked advantageously. Although the work undertaken by the Hexter Company is something enormous, still it is the only feasible plan of working that channel.

El Dorado.

(Special Correspondence).—A trip was recently made by the writer to a gravel property, near Grizzly Flats, that will rival the greatest gold producers. Forty years ago a large area was hydraulicked until the cement made further work under this method unprofitable. In the face of the bank two layers of paying gravel are well defined, each about 3¼ to 4½ feet deep, one immediately on the bedrock and another above, with a streak of lava probably 3 feet intervening. One year ago last month a tunnel was started from the hydraulicked face of the bank in a northeasterly direction, which has reached 750 feet and is double-tracked with steel T rails. The tunnel runs 560 feet up stream, from which there are two crosscuts of 85 and 105 feet respectively. The channel is cut one mile north by a deep canyon. There are 320 acres of land in this property, all on the channel. The gravel that I prospected, taken promiscuously, will average $5.00 per car. The black sand assays $306.00 per ton. In the spring a 20-stamp mill will be erected about 600 feet from the mouth of the tunnel, which will be operated under 260 feet pressure by water brought through a ditch seven miles in length, which is already constructed. There is now enough gravel in sight to operate a 20-stamp mill for three years. This proposition is owned by an English stock company of which Livingstone Gibson is president. Col. W. J. Sutherland is also interested. A. A. McDonald is superintending the work and keeps three shifts steadily employed. This will be known as Grizzly Flat Gravel Gold Mining Company.

On the Big Four, near Garden Valley, a whim has superceded the windlass, and the shaft is now 70 feet deep. The ore body continues at 2½ feet.

Since my last notes were forwarded, there were twenty-seven names of mine seekers registered at two of our hotels. Among these were six representatives of foreign capitalists. El Dorado county will gradually regain her prestige as a good county for investments in mining. Her former placer diggings, which produced millions of gold, were but a forerunner of greater wealth contained in her great quartz ledges which are now being unearthed deep down on the mother lode.

The tunnel on the Eagle mine, near Grizzly Flats, has reached 750 feet on a 3-foot ledge. There will be 250 feet backs when the tunnel is completed. This is the property of Mrs. Hoskins.

At Russian Diggings, near Grizzly Flats, Budworth & McLeod with four others, all from Livermore, are running a tunnel which has attained a length of 200 feet in a gravel property which they will operate as a drift and hydraulic proposition.

On the old Bullard mine, now owned by Joseph Lyons, the old tunnel has been cleaned out, track laid and a new tunnel extended to length of 250 feet, with 20 feet of stope added. The ledge is from 1 to 3 feet. A crushing of twenty tons of rock will be made next week.

Boiler, engine and hoist are being placed on the Amazon, beyond Kelsey. The shaft is down 125 feet, three skips pushing the work. The property is about eight miles north of Placerville.

On the Extra, near Grizzly Flats, twenty-five miles east of here, Claibourne & Pincini are stoping from a 400-foot tunnel. The ore body measures from 2 to 3 feet and is free milling, with small percentage of rich sulphurets.

Placerville, Oct. 13, '96.

F. B. Lloyd of Oakland has purchased from Bosquit, Noyes & French the Rodger & Crawford mining claims, near Placerville. These claims adjoin the group of fourteen properties recently bonded from Melton & Parlow by T. T. Lane.

C. H. King of Oakland has purchased from the Collins estate 170 acres of mineral land and ditch properties and will begin development work. This property is situated twenty-five miles north of Placerville.

Kern.

Californian: At Red Rock on Friday a miner named Nelson found two big gold nuggets—one 4½ ounces and the other 3½ ounces in weight. In the Red Rock district everybody seems to be taking out pay dirt.

Another rich strike is reported to have been found along the Randsburg road in the foothills adjacent to Randsburg canyon.

Mariposa.

(Special Correspondence).—The report that a sale of the Mariposa grant is on the tapis, mentioned by the MINING AND SCIENTIFIC PRESS last week, has been fully confirmed. As representing the owners of the grant Senator John P. Jones will reach San Francisco in a few days. There he will be joined by Hamilton Smith, the well-known mining expert who will act on behalf of the Exploration Company, Limited, of London. It is a significant fact that this influential corporation has just established offices in San Francisco to control what operations they may undertake on this coast. The general management will be in charge of Captain Mein, who recently returned to this State after taking a prominent part in the late South African troubles. As regards an inspection of the very extensive old workings on the Mariposa grant, Mr. Hamilton Smith will find it impossible to make a systematic investigation, as the ground has caved in nearly every direction. John D. Ludwig has about completed retimbering the Josephine mine and getting it ready for inspection. The depth there is only about 300 feet. The Princeton was the deepest mine, being down over 600 feet, but it is caved from top to bottom. Mr. Hamilton Smith's report will necessarily be of a general nature on the character and formation of the 44,000 acres comprised in the grant, and as such will be looked for with great interest as it will in its main features be equivalent almost to a report on the mother lode from Pinon Blanco to Mormon Bar. Of course there are the past records to go upon and these have already been carefully compiled and scrutinized. As was mentioned some months ago in the MINING AND SCIENTIFIC PRESS, Edward Bates Dorsey, accompanied by a shorthand reporter, spent considerable time in interviewing and taking statements on the ground from old residents who were familiar with the mines when they were in operation. Up to the present time it has been impossible to ascertain the price or terms upon which the grant has been offered, but the past record of the Exploration Company, Limited, makes it reasonably certain to predict that should it take over the property its operations will be prompt and on a large scale.

W. E. Selleck has returned to Chicago. Before leaving he let an extensive contract for tunneling to the westward in the mine at Haywards.

J. B. Irving of Carlisle, England, has bonded the Stud Horse Flat mines from Thorne, Waters and Jenkins. These mines are about 1½ miles below Benton mills on the south side of the Merced river, and immediately opposite the Red Banks. There are three full claims and beyond two years' assessment, but little work has been done.

The Hite's Cove and other mines in that section of the county have recently been coming in for some share of attention and parties are now on the ground inspecting. No details are yet available.

Capt. A. H. Ward has been on a visit of inspection to Pinon Blanco. He has returned to San Francisco entirely satisfied with prospects.

The Tyro mine is working on quartz from the 700-foot level. Joseph Buttgenbach, the president, is visiting the property. The mill is running night and day on rock reported richer than anything in the past history of the mine.

Coulterville, Oct. 13, '96.

Miner: Fred Whitman has put a force of men to work running a tunnel to cut the main ledge on the Bondurant. The tunnel will have to be run about 500 feet before the ledge is encountered.

The Laura La Grande mill at Hazel Green is running steadily on ore from the mine with good results. The company will add five stamps to their mill in the spring.

The Melvina three-compartment shaft is now down 700 feet. It is the intention of the company to sink to a depth of 1000 feet.

The Louisiana shaft is now down 175 feet, and the company intend to build a 10-stamp mill this fall.

Nevada.

Union: At the Cadmus mine during the past week specimens to the value of about $7000 have extracted. There are three parallel ledges, between which there are several stringers and the rock taken from these stringers is exceedingly rich. The company is putting up a new mill.

Transcript: The Forest mine, near the Mount George, is showing very encouraging results for the amount of labor and money expended. The ore is very rich, but the vein, which is one of three that form the main lode, is quite small, being from 3 to 6 inches wide. From all indications when these veins come together they will form an ore shoot 3 or 4 feet wide.

Union: At the Metropolitan mine at Moore's Flat the new mill has been started up. About sixteen men are employed and the prospects are encouraging. The ledge is a large one and the pay shoot is said to be an extensive one.

Transcript: The Montana mine, in Willow Valley district, has been bonded for two years to Francis N. Burns and C. H. Tubbs. They expect to commence work soon and reopen it. The ledge has paid from the grass roots and in times past was quite rich.

Placer.

Colfax *Sentinel*: The average yield per running foot of all channels on the Forest Hill divide is $150. This estimate is made by Ross E. Browne and Chas. F. Hoffman, superintendent of the Red Point mine.

The Hidden Treasure Company of Sunny South are making extensive improvements in the Dam claim at Centerville. Near $90,000 has been expended in development work during the past two years, and this without levying a single assessment. The main tunnel is in over 6000 feet. The numerous drifts and crosscuts leave the gravel in blocks 200x260 feet, ready for breasting.

Much development work is being done at the Glenn and Gray Eagle Consolidated drift mine on Bald mountain, above Secret House. This claim comprises about 400 acres of land.

The Big Channel claim, formerly owned by J. S. Ferrier of Todd's valley, has been sold to Eastern capitalists.

Plumas.

Independent: Horace Reynolds and others have purchased the Moore property on Rich bar and will work out the old town site, which, from its surroundings, is supposed to be rich.

Plumas *National-Bulletin*: The owners of the Frazier mining property at Granite Basin propose to remove the old Huntington mill and put in a 5 or 10-stamp mill.

San Diego.

Ramona *Sentinel*: The Owens mill is running day and night. On the 300-foot level they have run 250 feet on a ledge of good pay rock, which is 4 feet in width.

The machinery for the Ranchita mill has arrived.

The Cincinnati Belle mine is having a crushing of sixteen tons of rock at the Gold Fling mill.

The Chaparral mine is having its rock—about fifty tons—hauled to the Ready Relief mill.

Shasta.

Searchlight: It is reported that a large force will soon be put on at the Mammoth mine in Old Diggings district. The smelter at Keswick will help this camp, for the ore in the district contains a larger percentage of silicate than any other in the county, and this is what the smelter needs for flux. A tramway has been put in at Spring Creek to encourage shipping from that side of the river, and ore will be transported to the smelter in narrow gauge cars free of charge. Mines that could not be worked successfully before can now be worked profitably.

Much interest is being manifested as to the success of the new smelter at Keswick. The company has entered into a contract with R. G. Hart for twenty-five tons of ore daily from the Texas mine to be used as a flux at the smelter. Ore for the same purpose will be used from the Mammoth and Central mines. On the success of this enterprise much of Shasta county's future development depends.

Sierra.

Grass Valley *Union*: At Forest City, on the North Fork and Lucky Dog mines, twenty-two men are employed. In the former the prospects are encouraging, and it is expected that the deep channel will soon be tapped. The tunnel is now in 2600 feet.

Active work is going on at the Bald Mountain Consolidated, and the tunnel is now within 50 feet of the channel. Work has been prosecuted at this mine for over two years, and the tunnel is in 2350 feet. The channel is known to be rich, and the owners expect big results for their perseverance.

One of the paying gravel mines is the Mott, at the head of Slug canyon. Although not many men are employed, the property is on a paying basis. At this mine the tunnel is in over 1600 feet.

At the old Bald Mountain Extension mine considerable pay gravel is being taken out. For several years the mine paid dividends to its owners. Twenty-five men are employed.

The W. S. Hanley mine employs from fifteen to twenty men, and the work of prospecting the channel is going on.

There are several other mines of less importance in and around Forest City, all of which are being prospected.

Enterprise: Word comes from the Gold Bar mine at Cleghorn that some fine gravel is being encountred.

Work has been resumed on the prospect shaft of the Verdi placer claim on Mill creek.

Mountain Messenger: The Columbia Channel Mining Company has commenced a tunnel at the head of Wolf creek, near American hill, to develop the Henness Pass Ridge channel.

Siskiyou.

Yreka *Journal*: Bailey & Carrick are still taking out some rich ore at the Katie May mine, on Greenhorn. The rock will go about $100 a ton, which is the richest quartz in this district.

The Chinese company who are working the McConnell & Quinne claim, at the mouth of Humbug creek, are accomplishing some excellent work this season.

The Gold Ball mine on Salmon river is still closed and it is not known how soon it will again start up. The 20-stamp mill on this property, with the other modern methods of mining, is the largest plant in Siskiyou county.

Tuolumne.

Independent: At the Black Oak mine the cyanide plant is doing good work. The reduction of the ores by this process shows its value to recover fine gold at a profit, superior to any other treatment of these particular sulphurets.

Everything is being pushed rapidly at the Soulsby mine towards the completion of the new hoisting works, which consist of both water and steam auxiliary power machinery. There are forty men employed.

The Keltz mine has cleaned up with better results than expected. A new and rich chute had lately been struck. Instead of reducing the hands, as had been contemplated, additional men will be sent in.

The Rappahannock is crosscutting east and west, and sinking a shaft south of the main shaft, where they have exposed a good body of ore.

The Jumper mine is credited with having cleaned up during the past month nearly $160,000.

Union-Democrat: A contract for a 30-stamp mill at the Confidence has been let. The drift on the 800-foot level that runs north a distance of 1200 feet has been cleaned out and large bodies of good ore were found. In a short while over one hundred men will be on the pay roll. At present twenty-five are employed.

At the Santa Ysabel work has been started on the No. 3 shaft. Since the power plant was completed more men are being added to the working force, and plans have been outlined for a busy winter's development.

The Belleview is crushing about thirty tons a day. Improvements in the mill will be made this fall. A new source of power will be secured, as steam power is too expensive.

NEVADA.

It is reported that Captain De Lamar, the mining capitalist, has taken an option on the Rose group of mines at Tuscarora, Nev.

Territorial Enterprise: The Jumbo mining district, on the western slope of Mount Davidson, offers an unusual inducement for capital. Although every man working a claim in Jumbo mining district has unlimited confidence in the downward continuation of the rich deposits, they are all men without capital, and as outside districts in Nevada have always been neglected by moneyed men nothing which may be said to be in the way of genuine development has ever been done in this district.

White Pine *News*: The mill of the North American Mining Company at Egan canyon began crushing ore October 1st, and the company will make regular shipments to the head office at Salt Lake City. There are now at the mill and dumps of the mine some 3000 tons of high-grade gold ore, which will be treated by the cyanide process.

Manager C. H. Wilbur of the Golden Eagle and Ophir Consolidated Mining Companies promises in a few days to place upon this market a carload of ore exceeding in its auriferous values any that has ever been shipped from Central mining district. At the Golden Eagle the connection between the shaft and tunnel has been accomplished through an upraise, at which point there is reported 3¼ feet of ore, the vein having been followed in the tunnel for a distance of 300 feet. Upon the same property another tunnel has been driven upon

a parallel vein in which ore has been encountered that yields $35 in gold, and that, with the other metals, brings it up to that which prevails in the discovery ledge.

State Journal: One of the greatest achievements in mining accomplished in Nevada since Sutro designed and saw put into practical operation the tunnel which bears his name, has just been effected at Austin. The largest bodies of ore that have been discovered in this camp lie on Lander hill. Here were early operated the large South America, Frost, Lander and other works. Although these mines were all located high upon the hill, yet on getting down a few hundred feet, so great a flow of water was encountered as to make further progress downward on the ledge impracticable. In early days a tunnel had been started with a view of cutting the ledges. This tunnel was worked upon from time to time, but it remained for the present company to tap the network of mines.

Several men were put to work on the Phoenix mine this week and reports indicate that it is a regular bonanza. At the bottom of the shaft, which is 70 feet deep, the ledge has been crosscut for over 14 feet without having reached the wall. The ore is a gold-bearing quartz of a high grade.

OREGON.

Ashland *Tidings*: The Homestake mine at Woodville has been started again. The first grade ore will be shipped to Selby & Co.'s smelting works and the second grade ore will be milled at the Ashland mill.

A correspondent at Wimer says that numerous reports are coming to that place of a big strike on the headwaters of Pleasant creek, and causing much excitement. The reports are that a large semi-porphyry dike has been discovered by a party of prospectors. It is said to contain large quantities of free-milling ore, running from $100 to $200 a ton. About 100 men are at the scene of discovery.

Crow & Co. will ship a carload of ore from their Lost Flat ledge to the Ashland mill. The ore now being taken out is much richer than that sent to the mills several weeks ago. The quartz is packed on mules from the mine a distance of about fourteen miles, then hauled in wagons to Merlin, about six miles, then by rail to Ashland.

Grants Pass *Observer*: The Picket Creek Mining Company, with John Aiton as superintendent, are progressing rapidly in the construction of their ditch. They are working eight men and have completed two miles of ditch. Its full length will be 7½ miles.

Baker City *Bedrock Democrat*: Orders have been received to arrange for building a 10-stamp mill at the Columbia Mining Company's property in the Cable Cove district. In the spring it is the intention of the company to add thirty stamps, making forty in all. The Columbia is the property recently purchased by Eastern capitalists from the Cable Bros.

The Union-Companion Mining Company are preparing to run a tunnel on the Bradley mine, above the Union-Campanion.

BRITISH COLUMBIA.

Ashcroft *Mining Journal*: The Cariboo Gold Fields Company are preparing to drift their gravel that is too low to be hydraulicked.

Mining Review: On the first of October the second payment was made on the bond on the Iron Horse fraction, which is now controlled by J. W. Turner and partners, of Seattle. The claim is looking well. There are 2 feet of ore in the bottom of the shaft.

The C. & C. has been sold through Messrs. Evans, Coleman & Evans, of Vancouver, to an English syndicate; consideration, $25,000 in cash and £30,000 in paid up stock of a company with £100,000 capital.

The Colonna Gold Mining Company has been incorporated for $1,000,000. The property of the company is between the Monte Cristo, Evening Star, Silverine and Eddie J. There are three distinct veins running through the property, each one characterized by strong and wide iron cappings.

The War Eagle and Iron Mask have been sold to English capitalists.

Paul Gaston has sold the Gopher to an eastern Canadian syndicate, represented by John McMartin. The price of the property is reported to be $50,000 on a short bond. The Gopher adjoins the Homestake.

The Le Roi mine is now shipping about 150 tons of ore per day, 50 tons of which is taken from the big dump at the mine.

UTAH.

Salt Lake *Tribune*: Investigations have convinced M. M. Riley that ores recently uncovered by him and his associates in the La Sal mountains may be profitably handled in the form of a matte, and, to reduce it to that form, work upon a small roasting plant will commence in a very short time.

The new streak of high-grade ore encountered in the Creole consists of 18 inches overlying the manganese.

On the Wonder, at Mercur, the shaft has now attained a depth of 450 feet, at which level a streak of porphyry has appeared. The management is looking for a favorable change at any time.

The Bullion-Beck Company has paid in dividends $2,165,000. For nearly twenty years the Bullion-Beck has been almost continually producing, although at times the grade of ore has been a very indifferent one. Recently some very high-grade material was uncovered, however, and with that added to the concentrates, its earnings have materially increased. The output at present averages 100 tons a day, and there is milling ore enough now blocked out upon which to run for an indefinite period.

From those professing to have been let into the secret, it was learned yesterday that Frank Rockefeller, Secretary Severance and others of the Standard Oil Company have finally concluded their search for a foothold in Utah, and that conservative investments had been made in at least two camps. At Mammoth the property acquired by them consists of the Black Jack and Trail, lying southeast of the Ajax, and worked in a superficial way many years ago. A group of mines is also understood to have been made at Clifton.

Bingham *Bulletin*: Samuel Newhouse, representing an English syndicate, has purchased the Henry M. group of ten claims on Carr fork. The Henry M. and Highland Boy have been largely developed and show ore blocked out of a gross value greater than the amount paid for the group stated at $200,000, while some are partially opened up and others mere prospects, but of much promise. With nearly 100,000 tons of ore in sight, the greatest depth of the vein thus far attained is 200 feet. Developments are now to begin which will give the group a common working tunnel and explore the main vein at a considerably greater depth.

The ore shipments from Bingham in September amounted to 2941 tons.

The product from the cyanide mill running in connection with the Niagara Company's mines is stated to be about $10,000 per month, treating 35 tons of ore per day.

IDAHO.

(Special Correspondence.) — On the Bond work is going on as usual, and at the present depth of the shaft (100 feet) the ore shows up better than ever. The owners are drifting from the 65-foot level, there being 18 inches of ore in the face of the north drift. The owners are building a new mill of five stamps, as the former mill was not of sufficient capacity to handle their output.

The Climax, owned by Shields & Walker, is at present employing twelve men, and they will increase their force in a few days to double that number. The tunnel is now in 220 feet, and it will tap the ledge in 20 feet at a depth of 170 feet. There is also a force of men employed sinking on ore, of which there is a number of tons extracted, which will average $100 per ton. The owners will put a mill on this property this fall.

The Best Chance is now working with eight men under the management of Dr. H. H. Bole. A mill test made on the ore recently was very satisfactory to the owners. The crosscut tunnel will tap the ledge in a few days. There is a considerable quantity of ore in sight that runs high, and, with a tunnel run through to the ore, the property will produce in a short time.

A mill will be put on the Frisco by the first of October.

We have plenty of prospectors and a number of would-be prospectors, but what the camp requires is capital. Placer mining in the past season was a financial failure with a few exceptions.

Pierce, Idaho, October 7, '96.

MONTANA.

Butte *Miner*: Preparations for opening up the Moonlight mine, recently purchased by the Washoe Copper Company, are being pushed forward with activity. The hoisting plant used formerly in the mine has been removed and a larger plant placed in position.

The Alice Company is working its property on the lease system, and there are about 120 men getting out ore.

A shipment of bullion silver and gold has been made from the Alice mine at Walkerville to San Francisco. The Alice is now producing over $50,000 a month in silver.

Word was received yesterday by the board of directors of the Flint Creek Mining Company that a rich strike had been made this week on the Flint Creek mine, twelve miles from Philipsburg, in Granite county.

Inter-Mountain: The Alta mine, at Corbin, has closed down probably for all time. This mine covers an immense mountain, into which a tunnel nearly 2000 feet in length has been run. The whole mountain has been honeycombed and every pound of ore taken out. A winze was sunk to a depth of about 1000 feet in the hope of uncovering more, but it is said none was found, and the company has decided to close down the property. A new plant, built to treat several million tons of tailings, will soon be in operation.

COLORADO.

Denver *Republican*: At Cripple Creek the production of the Portland Company's properties during September was between 1800 and 2000 tons.

The Mount Rosa Company, which has declared a $5000 dividend, has $65,000 in the treasury.

The Trail on Bull hill shipped 200 tons of smelting ore this month from the 300-foot level. A permanent shaft house and ore bins will be built in preparation for winter, and the property will be thereafter worked on a large scale.

The Arcadia Company is now shipping the ore that accumulated under the restraining injunction, and expects to realize about $12,000 from the sale. The miners will be paid up and the residue, if any, deposited with the Court, pending the final adjudication of its adverse suit with the Marinette Company.

W. S. Stratton moved a discarded steam plant from the Independence into the main shaft house on the Plymouth Rock and will continue development of the ground contiguous to the Ironclad.

The Enterprise is crosscutting into Raven hill 100 feet from the 200-foot station. No ore is being produced from the systematic workings, but an occasional shipment is made from the old quarry-like opening on the surface. There is evidence of a big vein in the ground.

The Ingham Company has temporarily abandoned the old workings on Raven hill and is sinking a new shaft on the Mattie D. to exploit a vein cut in the tunnel.

The Independence mill is running again in the preliminary test of the new machinery.

The Christmas on Legal Tender hill is getting out about fifty tons of $53 ore a week.

The output from the Theresa last month exceeded that of August by 20 tons. The completion of the new shaft and surface improvements has led to an increase in the working force, and production will be much heavier from now on.

James M. Childs and M. A. Fyke have taken a $20,000 bond and lease for twenty months on the Colorado King, located on the west slope of Gold hill, just above Cripple Creek.

The aggregate production from the Elkton for the past month will be about $30,000 net, with an expense of probably $10,000. The output was seven cars of first grade, nine of second and eighteen of third, making about 500 tons of smelting ore in all.

Cripple Creek *Mail*: Listed companies in Cripple Creek are paying $100,500 a month in dividends, with the Doctor, Independence, Gold King, El Paso and Strong - unlisted profit earners - doing fully as much. But for the accumulation of reserve funds the dividends for October from the listed stocks alone would probably reach $170,500, divided as follows: Anchoria-Leland, $18,000; Moon-Anchor, $12,000; Portland, $60,000; Isabella, $22,500; Elkton, $25,000; Union, $12,000; Victor, $30,000.

SOUTH DAKOTA.

Black Hills *Times*: For several months past rumors have been rife in regard to the sale of the Haggin and Hearst interest in the Homestake properties. A few days ago a telegram in the eastern papers announced that the sale had been made through Hamilton Smith, the South Africa mining expert, to the Rothchilds syndicate, the reported price being from $5,000,000 to $10,000,000. About three months ago one of our residents was in New York city, and was informed there of the pending deal, the reason given for the sale being the serious illness of Mr. Haggin, who was desirous of placing his estate in such shape as to prevent litigation in case of his death. His interests and that of the Hearst estate being so intimately combined that it was almost impossible to make equitable division, both parties agreed to dispose of them. Some foundation is given to the report by local stockholders, who have wired the New York office, and the departure of T. J. Grier, superintendent of the company, and Judge Moody, its local attorney, for New York, accompanied by Jas. Milliken, of Philadelphia, owner of the Milliken Park group of mines, adjoining the Homestead property, and C. L. Woods, of Rapid City.

At the New York group the contractors now at work sinking a 100-foot shaft have reached a depth of 86 feet, the last 16 feet being in a solid body of iron pyrite. Above it the shaft is all in a mixture of quartz and talcose slate carrying an average value of $3 per ton. This new shaft was started with a view of intersecting the main vein exposed in the old workings 80 feet west.

The Wide World group of claims, situated on the easterly slope of Custer Peak, are being prospected and developed by the Pittsburg, Pa., parties to whom the group is under bond for a reasonable sum.

Considerable excitement has prevailed in Spearfish during the past few days over reported rich strikes in the West carbonate country. It is said that the whole Spearfish canyon has been located and staked from the chlorination plant to the Spearfish falls.

NEW MEXICO.

Silver City *Enterprise*: At Pinos Altos A. Hersberger is working ten men on his Western mine. He is running a crosscut from the 300-foot level to intersect a parallel vein to the Western.

The shaft on the Golden Giant mine has attained a depth of 400 feet. As soon as the shaft has reached the 450-foot level, drifts will be run north and south upon the vein. The vein continues to improve in size and quality of ore as depth is attained.

On the west side of the Pinos Altos range, Frank Brennan is developing the Talcose mine, a great vein belonging to the Dorsey group.

Superintendent Chandler is working fifteen men on the Mountain Key.

At Gold Hill, Dr. G. N. Wood has purchased the Bragaw & Potter stamp mill to crush ore from his several gold properties.

The Gold Mountain Mining Company has temporarily suspended operations on its properties.

The Southwestern Coal and Iron Company are shipping iron steadily from the Santa Rita and Hanover gulches.

John H. Bragaw will ship a sample lot from his copper mine, at Hanover, to the reduction works. If the ore is found to be of sufficiently high grade, twenty-five or thirty men will be put to work at once.

At Mogollon the Confidence mill has suspended operations temporarily, until the new tramway is completed. It is reported that a pipe line will be built up Whitewater canyon to supply water power for the mill before starting up again; and that the number of stamps in the mill will be increased.

The Little Fanny and Maud S. mines still remain closed down and will probably not resume operations till after the election.

ARIZONA.

Yuma *Sentinel*: The rich strikes made in the White Gold basin at Picacho are growing better.

In the new tunnel on the Noonday mine the rich ore has widened out from 2 to 6 feet with an average of over $100 per ton. The balance of the 20 feet of ore which the tunnel cuts runs from $10 to $15, with an average of $12 per ton in free gold.

In the Sambrano shaft the pay ore, which was 2 feet wide, is filling the shaft, 6½ feet; but what is considered the best strike yet made was struck in the old tunnel by Andres Villa. The whole shaft, 4½x6 feet, is in the richest ore ever found at Picacho. All three of these finds, which are on three different veins of ore, are within 1000 feet of the Golden Dream Company's new mill.

The crosscut in the Little Frank is 46 feet in length in good milling ore, while that in the Goldem Dream is 44 feet in good free-milling ore. The company have 25 men at work opening up these new finds.

Mohave County *Miner*: Supt. Koster has men at work on the Norma vein, and has just tapped a chute of 1200-ounce silver ore on the 200 level. On the 100 level good ore is being obtained, and milling ore of a good grade is being sent to the surface from the 300 level. Men have also been put to work on the Eureka and the mine recently purchased from A. L. McKesson.

In the Horn Silver and Occident big bodies of good ore are being found. As work on the mine progresses, it becomes apparent that the ledges between the walls have not been thoroughly exploited.

The White Hills Company has struck a good body of ore in the hanging wall of the G. A. R. mine. The ore was passed in sinking in the main shaft, but afterwards a feeder was found that led to the discovery.

Prescott *Journal-Miner*: Since commencing work on the Gold Note and Surprise mines, D. B. Gillett has had 1305 feet of development work done on the two claims in sinking and drifting. Both properties are looking well.

Machinery for the Planet-Saturn Company has commenced to arrive at Fool's gulch. They have contracted for the transportation of 200,000 pounds of machinery, in addition to a large amount of brick and lumber.

The sale of the Silver Flake mine, six miles south of Prescott, has been completed by the payment of the balance of the purchase price by Mackin and Philbin. The consideration is $33,600.

E. V. B. Hoes has deeded a number of mining claims to the Treasure Mountain Mining Company. The claims are located between the Last Chance mine and Granite mountain.

Prescott *Courier*: The last payment on the purchase price of $33,600 has been made on the Silver Flake mine by Messrs. Mackin & Philbin.

A shipment of ore which goes $140 per ton, gold, is being made from the Annie mine, Chaparral.

Good reports come from the Lottie mine, Big Bug district, where a winze is being driven, from the lower level, on a vein two feet in width, which averages one ounce gold per ton and 20 per cent copper.

Reports of a rich strike come from the Peck mine, in which, 30 feet from the main ledge is a 10-inch streak of ore which runs 700 ounces silver per ton; then 100 feet from the main ledge is another streak of ore which runs 2200 ounces; these ore bodies lie in a crosscut from the 250-foot level.

SOUTH AFRICA.

Hennen Jennings, consulting engineer of the Henry Nourse Gold Mining Company, in his annual report gives some data of value as to the treatment of tailings. He says: The system of double treatment of cyanide has been in operation, and during the last eight months the classified products have been treated separately, and all practical details may be summarized as follows: The pulp leaving the mill assayed 6.61 dwts. per ton; of this, 47,086 tons of classified sands assaying 6.8 dwts. per ton, 3,870 tons of concentrates 19.8 per ton, which yielded 13,389 ozs. fine gold, value £53,003 4s 10d, at a cost (equal to 5s per ton) of £12,894 3s 10d, leaving a profit of £40,109 1s.

The gold produced represents an extraction of 66 per cent of the contents of the product treated. About 70 per cent of the mill pulp has been treated, and 57 per cent of its gold contents recovered. The slimes stored have an average assay value of 3.82 dwts. per ton. The working costs have been reduced from 8s 9d to about 4s per ton, working on the basis of 60 stamps. A small extension of these works is in progress by which we can obtain a higher gold extraction. Summarizing results from both processes, the average value of milling ore was 70s 6d per ton, of this the mill recovered 62 per cent; cyanide works recovered 20 per cent. Total recovery 82 per cent.

Books Received.

We have received a handbook on "Mines, Miners and Minerals of Utah," by H. W. B. Kantner, which is a timely review of the present condition of the mining industry of that State. In no great mining field has there been greater advances made during the past two years than in Utah, and all the literature published before that time would give little idea of the work going on in that State at the present time. Published by R. W. Sloan, Salt Lake City, Utah.

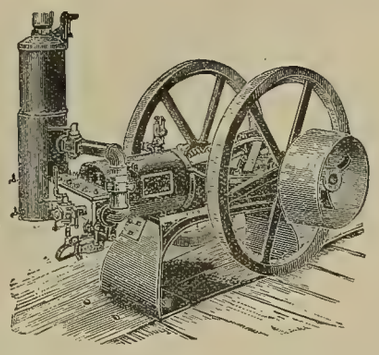
The Justinian Caire Company has published a catalogue of assayers' materials, laboratory glassware, mine and mill supplies, battery screens, etc., which will be of use to many in gaining an idea of the many new articles which have been brought out to meet the growing wants. It is a profusely illustrated volume of 250 pages. Published by The Justinian Caire Company, 521 Market St., San Francisco, Cal.

A Handbook on Rocks, by Professor J. F. Kemp of the Columbia School of Mines, New York, has been received. In this work Professor Kemp describes the different varieties of rocks, so as to make them recognizable without a microscope, and for the use of those who have need of such knowledge, but have not the opportunities and knowledge required for making a thorough and scientific investigation. He makes use of the old division of rocks into igneous and sedimentary and metamorphic, and describes each further division with much detail. In this short work Professor Kemp has attempted to popularize a very technical subject. The book is intended as a guide to rock determination without a microscope. He is to be complimented upon the arrangement of the work and the care in its compilation. It is particularly valuable in this country, because the instances cited are nearly all American. For sale by K. K. Taylor, Postoffice station J, New York city; price, $1.50.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING



THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.). ten hours' run, 8¾ gallons @ 14c.	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1¼c per horse power per hour; and on gasoline, 2½c per horse power per hour.

"HERCULES"

Gas, Gasoline or Distillate Engine.

READ THIS BEFORE PURCHASING.

Some manufacturers are making astounding statements of the economy of their crude oil gas engines, the great saving claimed being based on the very peculiar assumption that the refuse fuel has a ready market value and that each and every customer will place this refuse, or so-called asphaltum or lubricating (?) oil on the market—in fact, start up a retail asphaltum and lubricating oil business. Such a proposition will hardly appeal to common sense. The economy claimed in using paraffine oil is equally misleading. **Just bear in mind the indisputable fact that there is no paraffine base oil produced west of the Mississippi.** Some California crude oil contains paraffine in small quantities, but the base of such oils and all other California oils is asphaltum, without exception. Oil producers and refiners claim, and they ought to know, that less than 40 per cent of crude oil is capable of being transformed by heat into gas; consequently 60 per cent must be refuse, if used in gas engines.

Now, if you were using coal for steam purposes, which would you buy, clean coal at $6.00 per ton or coal which was 60 per cent stones and slate at $3.00 per ton, even if you could sell a load of stones, say for ballast, once in a while? We admit that gas engines will run on crude oil after a fashion, but the asphaltum cuts the cylinder, gums the valves and causes no end of trouble; besides the power obtained is much less, and **consequently you have to buy a larger engine than necessary—one-third larger.** Distillate oil is a product of asphaltum base—California crude oil—the distillate being obtained by evaporation, clean and clear without a trace of asphaltum in it. The price is only from 6½c to 9c per gallon, and every drop is fuel. No **"retail asphaltum or oil business"** about distillate: and

WE BUILD "HERCULES" DISTILLATE ENGINES

For Pumping, Hoisting, Marine and all Stationary Purposes. We make them simple; we make them strong; we make them reliable; we make them so strong, simple and reliable that we not only guarantee full power, but we guarantee **durability. Full power developed instantly without any previous heating.**

We Can Operate Them for One-Half the Cost of Any Crude Oil Engine Made.

OUR WORKS, Nos. 215, 217, 219, 221, 223, 225, 227, 229, 231 BAY STREET, were established in 1880. We have built hundreds of engines for Mines, Irrigating Plants, Stationary Purposes and Vessels since then—over 3000—and we guarantee that we build the highest grade engines in the market, and that they will give complete satisfaction, or we will refund your money. Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America. California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City.

AIDION ANTI-FRICTION BABBITT METAL.
Superior to Any Anti-Friction Babbitt Metal on the Market.
——USED FOR——
High Speed Engines, Dynamos, Rolling-Mills, Steamships, Railroads, Saw-Mills, Cotton-Mills, Paper-Mills, Woolen-Mills, Silk-Mills, Jute-Mills, Rubber-Mills, Sugar-Mills, and all Machinery Bearings.

Gray's Harbor Commercial Co., Cosmopolis, Wash., state:
"We have never used any other than AIDION since we have carried same in stock, and further, that we have babbitted up the 'Thrust Box' on one of our steamers, where nearly every other kind of Babbitt had been used. In every case it had been unsatisfactory, but since putting in the AIDION we have had no trouble in any way whatever."

1607-8 Manhattan Building, Chicago, Illinois.

KENDALL GOLD AND SILVER EXTRACTION CO.
THE KENDALL PROCESS is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.
The Kendall system of gold and silver milling comprises (1) the Extraction Process, in which the chemical solution extracts the values from ores; (2) the Recovery Process, by which the gold and silver are obtained from the solution, and (3) a modified form of plant, not indispensable, but permitting the use of unskilled labor.
Owners of mines and reduction works can obtain full information on application to
KENDALL GOLD AND SILVER EXTRACTION CO.....47 Broadway, New York City.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

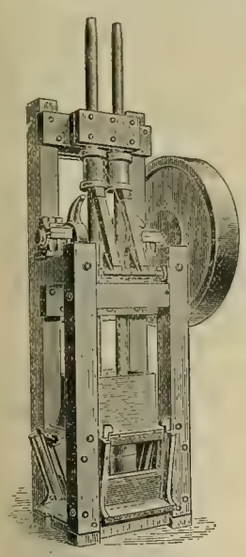
MINING AND MILLING MACHINERY.



"HENDY" IMPROVED
TRIPLE-DISCHARGE
Two Stamp Mills.

Superior to all other Mills of the same form for the following reasons:

First. Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.

Second. They are the cheapest mills to the stamp that were ever offered to miners.

Third. They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.

Fourth. They crush all kinds of ore, rock, cement or conglomerate perfectly.

Fifth. They are more durable, as the framework is secured to the mortar and thoroughly bolted together.

Sixth. The several parts are interchangeable and can be readily set up or taken down and duplicated.

Seventh. No skilled labor is required to assemble the parts.

Eighth. The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.

Weight of Stamps (each) ..... 850 pounds.
Weight of Mill complete..... 7500 "
Power required to drive..... 5 H. P.

CAPACITY, SIX TO TEN TONS PER DAY.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 15, 1896.

Jobbers in almost every branch of trade report the volume of goods going out larger than at the corresponding time last year, but they also say that the buying is for actual requirements and largely of the hand-to-mouth character. It is not the retail trade that buy only for near-by wants, for jobbers pursue the same course and will continue to do so until after election and business assumes its normal condition. This conservative policy is putting the trade, wholesale and retail, in most excellent position to take advantage of any change which may take place following the election. The activity in farm products, with several lines selling at higher and remunerative prices, combined with a steady investment in gold mines and an influx of gold miners, are having a most decided beneficial effect, which will be more pronounced in 1897. Iron workers and manufacturers in general continue to report good business. Several have increased the number of hands, so pressing is the call for structural material and machinery of various kinds. The textile manufacturers report, as a rule, running on full time so as to meet the demand for some line of goods.

The local money market is essentially unchanged. The commercial banks are meeting, with some degree of liberality, all legitimate wants of regular customers, but will not seek new business until after election, preferring, at present, to carry a large surplus of funds. Savings banks are not making any new loans, but are calling in some that are maturing. Private parties are putting out more money on realty, taking advantage of the present situation to get as high a rate of interest as possible. Merchants, as a rule, report continued fair to free remittances from about all sections of the coast, which places them in easy position. Eastern money markets have been working closer, but with no apparent stringency reported. Quite a number of the New York banks have called in loans, yet the offerings of money by outside parties and banks have tended to counteract its effect.

A cablegram from London to a leading financial journal at New York states that in all of the large offices, inquiries in regard to American securities are the rule, and every American is closely quizzed in regard to the situation. Berlin has a very large amount of idle money, although business throughout Germany is good. The same thing is true of London and the larger cities in England, but the accumulation of idle capital is said to be unprecedented. Paris seems to care little or nothing about American securities, but the field is practically unlimited in London and Berlin.

New York Silver Prices.

NEW YORK, Oct. 15.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	29 15-16	64¾
Saturday	29 15-16	64¾
Monday	29⅞	64⅝
Tuesday	29¾	64⅝
Wednesday	29¾	64⅝
Thursday	29⅞	64⅝

	Copper.	Lead.	Iron.	Tin.
Friday	10 75	2 75	10 25@12 00	12 65
Saturday	10 75	2 75	10 25@12 00	12 65
Monday	10 75	2 75	10 25@12 00	12 65
Tuesday	10 75	2 75	10 25@12 00	12 65
Wednesday	10 75	2 75	10 25@12 00	12 65

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, ⅔ per annum	7@8
Commercial Loans, prime	6@8
Call Loans, gilt edged	6@7
Call Loans, mixed securities	7@8
Mortgages, prime, taxes paid by lender	6@8
New York Sight Draft	Par
New York Telegraphic Transfer	.02½
London Bankers' 60 days	$4.82½
London Merchants	$4.81½
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	64⅝
Mexican Dollars	50½@51½

SILVER.—Contrary to general expectation, the markets at home and abroad sold lower the past week. At the declining prices, public advices state, there has been free selling by disgusted holders, who had bought at higher figures in expectation of better prices. Private advices are to the effect that strong parties have been for some time and are still buying, so as to better concentrate stocks—believing that higher prices will rule before long. The failure of the wheat crop in India has caused a light demand from that colony for silver, as has the stagnation of business in China. It is believed that with the coming year there will be a good demand from the Orient, India and Straits, which are large purchasers of the white metal. We are informed that there is a fair to good demand for legitimate trade wants, but a light inquiry for speculation. The export movements from this port in September were as follows: Hongkong, $191,000; Shanghai, $405,080; Bombay, $35,000; Central America, $103,000; total, $734,080.

MEXICAN DOLLARS.—The demand, although light, appears to be slowly increasing. The shipments in September were 90,652 to Hongkong and 9360 to Shanghai.

COPPER.—Although the markets at the East are reported easy, it is a well established fact that buyers have to pay full outside prices. The home demand is only fair, but the foreign demand continues liberal, which tends to keep supplies from accumulating.

The market is quoted as follows:

Ingot, jobbing	—@14
Ingot, wholesale	—@13
Sheet copper	—@16½

LEAD.—The market has ruled steady, with a tendency to firming up.

Our market is quoted as follows:

Pig	—	@	3 60
Bar	—	@	3 95
Sheet	—	@	5 25
Pipe	—	@	4 50

ANTIMONY.—The demand is fair, with the market steady at 7¾@8¼c in a jobbing way. New York mail advices quote 7¼ for Cookson's, 6½c for Hallett's and 6⅝c for Japanese, from store.

BORAX.—The general situation is practically unchanged.

The market is quoted as follows:

Refined, in car lots	6¼
Refined, in sacks	5¾
Powdered, in car lots	5¼
Concentrated, "	5¾

TIN.—For both pig and plate the demand is nominal, but the market seems to be steadier, in sympathy with a slightly better feeling abroad.

Pig, per lb			13¼
Plate, I C coke, heavy, per box	—	@	4 05
" " " light, "	—	@	3 95

POWDER.—There is a continued free demand.

The market is quoted as follows:

Hercules, No. 1, per pound	11¼c
" No. 2, "	8½c

IRON.—The consumption in this city is said to be fair, with a large increase looked for next year. At the East the markets appear to be steadier.

QUICKSILVER.—There is a good call on both home and export account. The exports by sea from this port for the first nine months of the calendar year aggregate, in flasks, 10,100, against 10,181 in 1895. The receipts at this city during that time aggregate 20,581 flasks, against 23,994 flasks in 1895.

The market is quoted as follows:

Domestic trade, per flask	36 50

For export, quotations are nominal but less than for home.

SHOT.—There is nothing new to report.

Drop, sizes smaller than B, per bag of 25 lbs	$1 20
Drop, B and larger sizes, " "	1 45
Buck, Balls and Chilled, do, " "	1 45

COAL. — The market is still in buyers' favor for cargoes in all positions. The consumption is steadily increasing, but the offerings are liberal.

COKE.—The market is quoted as follows:

Gas Companies'	—		—
English, to load	8 00	@	—
" spot, in bulk	8 00	@	9 00
" in sacks	8 50	@	—
Cumberland	—	@	—

NAILS.—The market is unchanged. The demand is good.

The market is quoted as follows:

Wire, carloads, basis per keg	$3 20
" jobbing, " "	3 30
Cut, carloads, " "	2 95
" jobbing, " "	3 05

LUMBER.—The demand is fair for home and export.

Redwood, Fluming	17 00	@	—
Pine	14 00	@	19 00
Spruce	26 00	@	31 00
